BEFORE THE BOARD OF COMMISSIONERS OF LANE COUNTY, OREGON

ORDINANCE NO. PA 1340	IN THE MATTER OF CO-ADOPTING THE CITY OF EUGENE 2035 TRANSPORTATION SYSTEM PLAN FOR APPLICATION WITHIN THE URBANIZABLE AREA OUTSIDE THE EUGENE CITY LIMITS; AMENDING THE EUGENE-SPRINGFIELD METROPOLITAN AREA GENERAL PLAN; AMENDING THE EUGENE-SPRINGFIELD METROPOLITAN AREA TRANSPORTATION PLAN (TRANSPLAN); PROVIDING FOR AN EFFECTIVE DATE; AND ADOPTING SAVINGS AND SEVERABILITY CLAUSES. (APPLICANT: CITY OF Eugene).

WHEREAS, the Eugene-Springfield Metropolitan Area Transportation Plan (*TransPlan*) provides the basis for the Transportation Element of the Eugene-Springfield Metropolitan Area General Plan (Metro Plan) and is a comprehensive 20-year plan to guide regional transportation investments; and

WHEREAS, Oregon Administrative Rules (OAR) Section 660, Division 12, specifies the requirements of the Oregon Transportation Planning Rule that requires cities and counties to prepare and adopt local transportation system plans for lands within their planning jurisdiction as part of their comprehensive plans [OAR 660-12-015(3) & (4)]; and

WHEREAS, the Eugene 2035 Transportation System Plan (*2035 TSP*) is a comprehensive 20-year plan to guide transportation investments within the City of Eugene UGB area (and the Airport Master Plan area) and, upon adoption, will serve as the City of Eugene's local transportation system plan; and

WHEREAS, text amendments are needed to the *Metro Plan* and *TransPlan* to maintain consistency between these documents and the *2035 TSP*, once the *2035 TSP* is adopted; and

WHEREAS, the City of Eugene Planning Commission and the Lane County Planning Commission conducted a joint public hearing on June 21, 2016, and provided their recommendations to the Eugene City Council and Board of County Commissioners, respectively, to adopt the *2035 TSP* as an amendment to the *Metro Plan*, the City's comprehensive plan; and

WHEREAS, the City of Eugene requested Lane County action to co-adopt the *2035 TSP* as an amendment to the *Metro Plan* for application within the urbanizable area outside the Eugene City Limits; and

WHEREAS, substantial evidence exists in the record indicating that the proposal meets the applicable requirements of the *Metro Plan*, Lane Code, and state and local law; and

WHEREAS, the Board of County Commissioners conducted a joint public hearing with the Eugene City Council on this Ordinance on March 6, 2016 and is now ready to take action.

NOW, THEREFORE, the Board of County Commissioners **Ordains** as follows:

Section 1. Volume I of the Eugene 2035 Transportation System Plan (not including Attachment B, City Street Classification Map) and Appendices A – D of Volume II of the Eugene

2035 Transportation System Plan, attached to this Ordinance as Exhibit B and incorporated herein by this reference, is hereby adopted as part of the Eugene-Springfield Metropolitan Area General Plan to serve as Eugene's local transportation system plan.

Section 2. The Eugene Springfield Metropolitan Area General Plan is amended to add an Appendix E to the list of Appendices in Chapter I, Introduction, under the heading "Relationship to Other Plans, Policies, and Reports" by adding the following text after Appendix D:

The following Metro Plan appendix is available at the City of Eugene Planning and Development Department:

Appendix E Eugene 2035 Transportation System Plan

Section 3. The Transportation Element at Section III.F. of the Eugene Springfield Metropolitan Area General Plan is amended as described in Subsections A, B and C of this Section.

A. A new bullet entitled "Eugene Transportation System Plan" is added to the list of topics under the "Findings and Policies" heading as follows:
   - Land Use
   - Transportation Demand Management
   - Transportation System Improvements
     - System-Wide
     - Roadways
     - Transit
     - Bicycle
     - Pedestrian
     - Goods Movement
     - Other Modes
   - Finance
   - ***Eugene Transportation System Plan***

B. Subsection b. of Policy F.15 is amended as follows:

b. Acceptable and reliable performance is defined by the following levels of service under peak hour traffic conditions:
   (1) ***Within Eugene's transportation planning area, the*** [~~L~~]*l*evel of [S]service [~~F within Eugene's Downtown Traffic Impact Analysis Exempt Area~~] ***set forth in the Eugene 2035 Transportation System Plan***;
   ~~(2) Level of Service E within the portion of Eugene's Central Area Transportation Study (CATS) area that is not within Eugene's Downtown Traffic Impact Analysis Exempt Area;~~ and
   ([~~3~~]*2*) Level of Service D elsewhere.

C. A new topic and policy are added after Policy F.38 as follows:

Eugene Transportation System Plan

Policy

F.39 The Eugene 2035 Transportation System Plan, not including the transportation financing program, is the City of Eugene's local transportation system plan and is included as Appendix E to the Metro Plan.

Section 4. Subsection 2 of TSI Roadway Policy #2 of the Eugene-Springfield Transportation System Plan (TransPlan), is amended to provide as follows:

TSI Roadway Policy #2: Motor Vehicle Level of Service

2. Acceptable and reliable performance is defined by the following levels of service under peak hour traffic conditions:
   a. ***Within Eugene's transportation planning area, the*** [~~L~~]*l*evel of [~~S~~]*s*ervice [~~F within Eugene's Downtown Traffic Impact Analysis Exempt Area~~] ***set forth in the Eugene 2035 Transportation System Plan***;
   ~~b. Level of Service E within the portion of Eugene's Central Area Transportation Study (CATS) area that is not within Eugene's Downtown Traffic Impact Analysis Exempt Area;~~ and
   ([~~c~~]*b*) Level of Service D elsewhere.

Section 5. Chapter 3, page 39 of the Eugene-Springfield Transportation System Plan (*TransPlan*), is amended to provide as follows:

[~~*TransPlan* serves as the bicycle plan for Eugene.~~] ***The Eugene 2035 Transportation System Plan serves as the pedestrian and bicycle master plan for Eugene.*** The *Springfield Bicycle Plan* (1998) serves as the bicycle master plan for Springfield. To the extent that the cities of Eugene and Springfield wish to adopt, amend, or maintain bicycle master plans, those plans must be consistent with *TransPlan.* All bikeways and other bicycle system improvements will be designed to meet standards specified in the *Oregon Bicycle and Pedestrian Plan* (1995), whenever possible.

Section 6. Effective Date.

A. Except as otherwise delayed pursuant to Subsection B of this Section, the provisions of this Ordinance shall become effective 30 days from the date of passage by the Board, or upon the date that the Eugene City Council has adopted an ordinance containing provisions substantially identical to those in this Ordinance, whichever is later.

B. The change to motor vehicle levels of service for the ODOT facilities described at Table 4.1 of the Eugene 2035 Transportation System Plan shall become effective upon the Oregon Highway Commission's written acceptance of the changed levels of service for the ODOT facilities described in Table 4.1 of the Eugene 2035 Transportation System Plan. Such written acceptance may, but is not required to, take the form of an action of the Oregon Highway Commission that amends the Oregon Highway Plan to change levels of service for the ODOT facilities to those described in Table 4.1.

Section 7. Savings and Severability Clauses

If any section, subsection, sentence, clause, phrase or portion of this Ordinance is for any reason held invalid or unconstitutional by any court of competent jurisdiction, such portion shall be deemed a separate, distinct, and independent provision, and such holding shall not affect the validity of the remaining portions thereof.

FURTHER, although not part of this Ordinance, the Board of County Commissioners adopts findings as set forth in Exhibit 'A' attached and incorporated by this reference, in support of this action.

ENACTED this 11th day of July, 2017.

Pat Farr, Chair, Lane County Board of Commissioners

Recording Secretary for this Meeting of the Board

APPROVED AS TO FORM
Date 7-10-17 Lane County
OFFICE OF LEGAL COUNSEL

Exhibit A to Ordinance Concerning Long Range Transportation Planning

Findings in Support of
An Ordinance Concerning Long-Range Transportation Planning

(Adopting the *Eugene 2035 TSP*; Amending the *Metro Plan, TransPlan,*
Eugene Code Chapter 9, Ordinance No. 20528, and the Eugene Street Classification Map;
and Repealing the 2003 Central Area Transportation Study)

Overview

For decades the Eugene-Springfield metropolitan area had a shared regional comprehensive plan and regional transportation system plan, known as the *Metro Plan* and *TransPlan*. These plans guided transportation decisions for both Eugene and Springfield inside a shared urban growth boundary. For both cities, *TransPlan* functioned as the Local Transportation System Plan and the Regional Transportation System Plan. In 2007, the Oregon Legislature passed House Bill 3337, which required Eugene and Springfield to develop separate urban growth boundaries. As a result, Eugene began the *Envision Eugene* project, including Eugene-specific transportation planning. Additionally, in October 2008, the State's Land Conservation and Development Commission approved a regional work plan to prepare and adopt a *TransPlan* update to address federally mandated regional transportation planning requirements. So that each city's local transportation system plans could serve as the backbone of the regional *TransPlan* update, the cities of Eugene, Springfield and Coburg undertook local transportation planning efforts in advance of the *TransPlan* update. Within the last few years the cities of Springfield and Coburg have adopted their local transportation system plans (both co-adopted by Lane County); once the *Eugene 2035 Transportation System Plan (2035 TSP)* is adopted, the region's *TransPlan* update will move forward.

The *2035 TSP* meets state requirements for a local transportation system plan and is a resource for future transportation decision making within the City of Eugene. The *2035 TSP* identifies the preferred future multi-modal transportation system and articulates the City's goals and policies related to this transportation system. It also identifies the function, capacity, and location of future facilities, and identifies planning-level costs for improvements needed to support expected development and growth, and possible sources of system funding. The *2035 TSP* is intended to provide the City with flexibility as critical transportation investments are prioritized and funded.

The *2035 TSP* ensures the vision for the transportation system meets community needs, communicates the City's aspirations, conforms to state and regional policies, and provides an infrastructure and program plan to meet these community, regional, and state needs. The *2035 TSP* includes a total of 6 chapters, including: Chapter 1 – Introduction; Chapter 2 – Goals, Policies, and Actions; Chapter 3 – Needs Assessment and Evaluation; Chapter 4 – Creating Multimodal Systems; Chapter 5 – Transportation Priorities and Project Categories; and Chapter 6 – Transportation Funding and Implementation.

While reflective of Eugene's current planning work, the *2035 TSP* is a component of the Eugene-Springfield Metropolitan Area General Plan (*Metro Plan*) and is being adopted as part of the *Metro Plan*. The findings that follow demonstrate that the *2035 TSP,* and the entire *2035 TSP* adoption package, is consistent with applicable approval criteria. The *2035 TSP* adoption package consists of:

1. The Eugene 2035 Transportation System Plan
2. Conforming amendments to the *Metro Plan*
3. Conforming amendments to *TransPlan*

4. Conforming amendments to Eugene Code Chapter 9

5. Amendment to Eugene Ordinance No. 20528 to delete section 67 (to remove the limitation on trips)

6. Repeal of Eugene 2003 Central Area Transportation Study (CATS)

7. Eugene Street Classification Map amendments.

I. *Metro Plan* Amendments, *TransPlan* Amendments and *2035 TSP* Adoption ("the amendments")

Amendments to the *Metro Plan* and *TransPlan* and adoption of the *2035 TSP* are all governed by the *Metro Plan* amendment approval criteria. Eugene and Lane County have identical approval criteria for *Metro Plan* amendments (below), set forth in Eugene Code 9.7735 and Lane Code 12.225.

(1) The proposed amendment is consistent with the relevant Statewide Planning Goals; and
(2) The proposed amendment does not make the *Metro Plan* internally inconsistent.
(3) When the city-specific local comprehensive plan also applies, the proposed amendment is consistent with the city-specific local comprehensive plan.

Throughout the findings set forth below, the *2035 TSP* and the conforming *Metro Plan* and *TransPlan* amendments are collectively referred to the "*2035 TSP"* or "the amendments."

(1) The amendment is consistent with applicable statewide planning goals adopted by the Land Conservation and Development Commission.

Goal 1 - Citizen Involvement. *To develop a citizen involvement program that insures the opportunity for citizens to be involved in all phases of the planning process.*

The City of Eugene and Lane County have acknowledged citizen involvement programs and acknowledged processes for securing citizen input on all proposed *Metro Plan* amendments. The governing bodies' codes require that notice of the proposed amendments be given and public hearings be held prior to adoption. Notification of the proposed amendments and opportunities for public participation in these amendments were consistent with the acknowledged citizen involvement programs.

This goal was met through an extensive public involvement process. A Community Involvement Strategy for the update of the Eugene Transportation System Plan was developed in preparation of the project. This Program was reviewed and endorsed by the Eugene Planning Commission, which acts as the Committee for Citizen Involvement. The program outlined the information, outreach methods, and involvement opportunities available to the citizens during the process. Information was distributed and input solicited throughout the process. Opportunities for engagement included: a project website (including web-based surveys); targeted outreach with local community service organizations and Planning Commission, Sustainability Commission, and City Council.

During preparation of the draft TSP, a Transportation Community Resource Group (TCRG) was created to invite participation from many of the original members of the Envision Eugene Community Resource Group (CRG), the Pedestrian and Bicycle Master Plan project advisory committee, the city's standing

Bicycle and Pedestrian Advisory Committee (BPAC), a multi-agency Technical Advisory Committee, staff from the Oregon Department of Land Conservation and Development (DLCD) and Department of Transportation (ODOT), Lane County staff, and the public at large. The TCRG spent years studying and providing advice to staff on land use planning, bicycle and pedestrian planning, transit planning, demand management techniques, street design, traffic congestion, sustainability, efforts to reduce greenhouse gas emissions, and transportation funding. The TCRG was instrumental in creating the goals, policies, potential action items, and project lists for the draft TSP.

The Eugene and Lane County Planning Commissions public hearing on the proposal was duly noticed to all neighborhood organizations, community groups and individuals who have requested notice, as well as to the City of Springfield. Additionally, notice was set to each individual that received notice of Eugene Ordinance No. 20528 and to everyone that owns property on a street that is proposed to be reclassified. Notice of the public hearing was also published in the Register Guard. The Eugene City Council and Lane County Board of Commissioners joint public hearing to consider approval, modification, or denial of the amendments was duly noticed. These processes afford ample opportunity for citizen involvement consistent with Goal 1.

As a result of this extensive public involvement process, the proposed amendments meet the requirements of Goal 1.

Goal 2 - Land Use Planning. *To establish a land use planning process and policy framework as a basis for all decisions and actions related to use of land and to assure an adequate factual basis for such decisions and actions.*

The Eugene-Springfield Metropolitan Area General Plan (*Metro Plan*) is the policy tool that provides a basis for decision-making in this area. The *Metro Plan* was acknowledged by the State in 1982 to be in compliance with statewide planning goals, and again after periodic review in 2004. This amendment to the *Metro Plan* is undertaken to adopt the *2035 TSP* in a manner consistent with current conditions and citizen values. The amendment to the *Metro Plan* to recognize the *2035 TSP* is being processed as a Type II procedure, which requires any applicable statewide planning goals, federal or state statutes or regulations, Metro regulations, comprehensive plan policies, and City's implementing ordinances be addressed as part of the decision-making process. Upon adoption, the *2035 TSP* will replace *TransPlan* as Eugene's local TSP. Because *TransPlan* remains a refinement to the *Metro Plan* and will continue to serve as the Regional Transportation System Plan (RTSP) until the RTSP is updated (per an LCDC work plan), the adopted performance measure in *TransPlan* are still applicable.

These findings and the record show that there is an adequate factual base for the City's and County's decision concerning the amendments. Goal 2 requires that plans be coordinated with the plans of affected governmental units and that opportunities be provided for review and comment by affected governmental units. The Goal 2 coordination requirement is met when the adopting governmental bodies engage in an exchange, or invite such an exchange, between the adopting bodies and any affected governmental unit and when the adopting bodies use the information obtained in the exchange to balance the needs of the citizens. To comply with the Goal 2 coordination requirement, the two jurisdictions coordinated the review of these amendments with all affected governmental units. Notice of the proposed amendments and information about where the materials would be available for review was mailed to all parties that had requested such notice.

There are no Goal 2 exceptions required for the amendments. Therefore, the amendments are consistent with Statewide Planning Goal 2.

Goal 3 - Agricultural Lands. *To preserve agricultural lands.*

The statewide planning goals relate to agricultural lands in Oregon and is not applicable to the proposed amendments.

Goal 4 - Forest Lands. *To conserve forest lands.*

The statewide planning goal relate to forest lands in Oregon and is not applicable to the proposed amendments.

Goal 5 - Open Spaces, Scenic and Historic Areas, and Natural Resources. *To conserve open space and protect natural and scenic resources.*

OAR 660-023-0250(3) provides: Local governments are not required to apply Goal 5 in consideration of a PAPA unless the PAPA affects a Goal 5 resource. For purposes of this section, a PAPA would affect a Goal 5 resource only if:

- *(a) The PAPA creates or amends a resource list or a portion of an acknowledged plan or land use regulation adopted in order to protect a significant Goal 5 resource or to address specific requirements of Goal 5;*
- *(b) The PAPA allows new uses that could be conflicting uses with a particular significant Goal 5 resource site on an acknowledged resource list; or*
- *(c) The PAPA amends an acknowledged UGB and factual information is submitted demonstrating that a resource site, or the impact areas of such a site, is included in the amended UGB area.*

These amendments do not create or amend the City's list of Goal 5 resources, do not amend a code provision adopted to address specific requirements of Goal 5, do not allow new uses that could be conflicting uses with a significant Goal 5 resource site and do not amend the acknowledged urban growth boundary. Therefore, Statewide Planning Goal 5 does not apply.

Goal 6 - Air, Water and Land Resource Quality. *To maintain and improve the quality of the air, water and land resources of the state.*

Goal 6 addresses waste and process discharges from development, and is aimed at protecting air, water and land from impacts from those discharges. The amendments to not affect the City's ability to provide for clean air, water or land resources. The *2035 TSP* was developed following the rules and guidance found in Oregon Revised Statute 660-012 and the Central Lane MPO Regional Transportation Plan (RTP). Both outline strategies for decreasing vehicle miles traveled and single- occupancy vehicle trips, which are intended to help improve air quality in the Central Lane MPO Area.

The *2035 TSP* contains policies related to development along key multi-modal corridors, transportation demand management and the encouragement of transportation without reliance on automobiles, including transit, bicycles, and pedestrian travel. The *2035 TSP* incorporates the Eugene Climate Recovery Ordinance goal of by year 2030 reducing community-wide use of fossil fuels by 50 percent compared to 2010 usage. This goal and policies are related to the need to maintain and improve the air quality in the metropolitan area. Projects identified in the *2035 TSP* will be designed and constructed in accordance with applicable federal, state, and local regulations.

Additionally, from 2013 to mid-2015 the City participated in a scenario planning process led by the Central Lane MPO. The scenario planning process examined how transportation policies might affect equity, public health, economic vitality, and greenhouse gas emissions in the region. The state required the project partners to examine at least one scenario that would achieve a 20 percent reduction (below 2005 emissions levels) in greenhouse gas emissions from light vehicles. Generally, the 20 percent greenhouse gas emission reduction target of the scenario planning study is consistent with the goal of the Climate Recovery Ordinance. While the preferred scenario selected by the Central Lane MPO is not a statement of regional policy and the strategies are not intended to be directive or regulatory, the *2035 TSP* incorporates and advances many of the strategies identified by the Central Lane MPO as a way of achieving the preferred scenario. Some specific examples of how the *2035 TSP* advances the preferred scenario strategies are as follows:

1. The *2035 TSP* plans for significant investment in active transportation over the next 20 years. (Active transportation strategies #1 & #2)
    - Of the 264 projects planned in the *2035 TSP* to be built over the next 20 years (excluding those to be built upon development), 239 of the projects are entirely pedestrian and bicycle projects; those projects include 89 neighborhood greenways, 22 on-street bike lanes, 18 shared use paths, 12 protected bike lanes, and 85 separated path/sidewalk projects.
    - Six of the 264 projects are transit projects, which include improving frequent transit service and multimodal travel along numerous transit corridors.
    - These 245 bicycle, pedestrian, and transit projects represent 51% of the total transportation dollars that are planned to be spent over the next 20 years.
    - Of the 19 remaining projects, 6 of the projects are complete street upgrades to existing roadways; all 6 of these projects have a significant bicycle and pedestrian component. These complete street projects represent an additional 10% of the total transportation dollars.
    - Not counting the three rail projects (which amount for 6% of the total transportation dollars), only three projects planned for the next 20 years have no explicit bicycle, pedestrian, or transit component contained in their project descriptions. These three projects represent approximately 8% of the total transportation dollars that are planned to be spent over the next 20 years.

2. Establishment of a bike share program is currently underway and is one of the *2035 TSP*'s four bicycle policies. (Active transportation strategy #3)

3. Identified potential action items for meeting *2035 TSP* policy objectives include providing education and awareness programs, such as *SmartTrips* and school-based transportation options (including Safe Routes to School) to improve safety for all travelers and providing support for Safe Route to School programs and other programs that create safe walking

conditions between residences and schools and other neighborhood destinations. (Active transportation strategy #5, Education and marketing strategy #1).

4. A system-wide policy of the *2035 TSP* is fostering neighborhoods where Eugene residents can meet most of their basic daily needs without an automobile by providing streets, sidewalks, bikeways, and access to transit in an inviting environment where all travelers feel safe and secure. The related potential action item is the creation of a strategy to facilitate 90 percent of Eugene residences to be within 20-minute neighborhoods. (Active transportation strategy #6)

5. The *2035 TSP* policies promote improved transit services that are integrated through context specific multimodal planning for all Key Corridors. One of the four transit policies in the *2035 TSP* is to collaborate with Lane Transit District to provide a network of high capacity, frequent, and reliable transit services, including consideration of Bus Rapid Transit, to the City's identified Key Corridors and to Frequent Transit Corridors as defined by Lane Transit District's Long Range Transit Plan. Additionally, the *2035 TSP* includes $171.4 million in transit projects that support the transit policies and the identified transit needs. (Transit strategies #3 and #4).

6. The six multimodal/transit projects planned for the next 20 years include the improvement of frequent transit service and multimodal travel along Coburg Road, River Road, Highway 99, 30th Avenue and Amazon Parkway, new transfer stations, and enhanced pedestrian crossings. Additionally, an identified potential action item is to review City Code and amend it if needed to enable additional opportunities to provide bikeways and improved pedestrian connections between key destinations, transit stops, and residential areas with new development and redevelopment. (Transit strategies #5 and #7).

7. Identified potential action items include aligning the City's land use and parking regulating to encourage walking, biking, and use of public transit and periodically reviewing parking needs in the downtown, Federal Courthouse, and riverfront districts and balance supply with other objectives, such as economic vitality; support for transit, walking, and biking; reduced consumption of fossil fuels; and human-scaled urban form. Additionally, for more than 10 years the City has had in place *Standards for Transportation Demand Management Programs* that provide a mechanism to vary the number of required off-street parking spaces by providing a strategy for reducing vehicle use and parking demand and using benchmarks to measure program effectiveness. (Parking management strategy #2)

8. The *2035 TSP* recognizes the Regional Transportation Options Plan (RTOP) adopted by the Central Lane MPO as the regional guidance for programs that reduce reliance on single-occupancy vehicles and identifies seven key programs and services, including: SmartTrips individualized marketing programs to encourage active transportation choices; School-Based Transportation Options: Build off existing Safe Routes to School programs to include coordinated program with ridesharing and transit promotion and expand the program to middle and high schools; Rideshare (carpooling and vanpooling); and, LTD's Group Bus Pass program. (Education and marketing strategies #1, 3, and #6)

As a result, the proposed amendments are in compliance with Goal 6.

Goal 7 - Areas Subject to Natural Disasters and Hazards. *To protect life and property from natural disasters and hazards.*

Goal 7 requires that local government planning programs include provisions to protect people and property from natural hazards such as floods, landslides, earthquakes and related hazards, tsunamis and wildfires. The Goal prohibits a development in natural hazard areas without appropriate safeguards. The amendments do not affect the City's restrictions on development in areas subject to natural disasters and hazards. Further, the amendments do not allow for new development that could result in a natural hazard. Therefore, Statewide Planning Goal 7 does not apply.

Goal 8 - Recreational Needs. *To satisfy the recreational needs of the citizens of the state and visitors, and where appropriate, to provide for the siting of necessary recreational facilities including destination resorts.*

Goal 8 ensures the provision of recreational facilities to Oregon citizens and is primarily concerned with the provision of those facilities in non-urban areas of the state. Goal 8 also allows, but does not require, the City to create an inventory of recreational needs. The amendments do not affect the current provisions for recreation areas, facilities or recreational opportunities, nor will the amendments affect access to existing or future recreational facilities. Further, the amendments do not change the *Metro Plan* and *TransPlan* policies that support access to recreational facilities with the Metropolitan area and to recreations opportunities outside the area or delete any planned transportation projects that would make recreational facilities more available. Therefore, the amendments are consistent with Goal 8.

Goal 9 - Economic Development. *To provide adequate opportunities throughout the state for a variety of economic activities vital to the health, welfare, and prosperity of Oregon's citizens.*

Goal 9 requires cities to evaluate the supply and demand of commercial and industrial land relative to community economic objectives. The Administrative Rule for Statewide Planning Goal 9 (OAR 660 Division 9) requires that the City "[p]rovide for at least an adequate supply of sites of suitable sizes, types, location, and service levels for a variety of industrial and commercial uses consistent with plan policies[.]" Among other things, the rule requires that cities complete an "Economic Opportunities Analysis." OAR 660-009-0015. Based on the Economic Opportunities Analysis, cities are to prepare Industrial and Commercial Development Policies. OAR 660-009-0020. Finally OAR 660-009-0025 requires that cities designate industrial and commercial lands sufficient to meet short and long term needs. OAR 660-009-0010(2) provides that the detailed planning requirements imposed by OAR 660 Division 9 apply "at the time of each periodic review of the plan (ORS 197.712(3))." The Eugene Commercial Lands Study (1992) is acknowledged for compliance with the requirements of Goal 9 and the corresponding Administrative Rule.

The adoption of the amendments will not impact the supply of industrial or commercial lands and will not change or conflict with the economic policies of *Metro Plan*. The amendments do not change the *TransPlan* and *Metro Plan* policies directed toward enhancing the economic opportunity available within the Eugene-Springfield area by assuring adequate public facilities and infrastructure to provide a transportation system that is efficient, safe, interconnected and economically viable and fiscally stable. The amendments seek to provide a multi-modal transportation system to meet the needs of the

community and accommodate economic growth, within projected revenues, into the future. The proposed amendments are consistent with Goal 9.

Goal 10 - Housing. To provide for the housing needs of the citizens of the state.

The Eugene-Springfield Metropolitan Area Residential Lanes and Housing Study (1999) is acknowledged for compliance with Goal 10. The adoption of the amendments will not impact the supply of residential lands and will not result in any change or conflict with the housing policies of the *Metro Plan.* The amendments seeks to provide a multi-modal transportation system to meet the needs of the community into the future, including accommodating its housing needs. The proposed amendments are consistent with Goal 10.

Goal 11- Public Facilities and Services. *To plan and develop a timely, orderly and efficient arrangement of public facilities and services to serve as a framework for urban and rural development.*

The Eugene-Springfield Metropolitan Area is currently in compliance with Goal 11 through its acknowledged Public Facilities and Services Plan (PFSP), Comprehensive Plan, and adopted Transportation System Plan, *TransPlan*. The amendments will not result in any change or conflict with the Comprehensive Plan, PFSP, or *TransPlan*. The proposed amendments will update the transportation element of the *Metro Plan* by replacing *TransPlan* as the locally adopted TSP. As a result, the amendments are in compliance with Goal 11.

Goal 12- Transportation. *To provide and encourage a safe, convenient and economic transportation system.*

Goal 12 is implemented through the Transportation Planning Rule (TPR), as defined in Oregon Administrative Rule OAR 660-012-0000, et seq. The proposed amendments are consistent with all applicable provisions of OAR 660-012-0010. Further, the amendments are consistent with, and a further step toward fulfillment of the Regional Transportation Work Plan approved pursuant to OAR 660-012-0016(2)(b) by the Land Conservation and Development Commission on October 16, 2008.

The amendments adopt the *2035 TSP*, which was completed following the rules outlined in the Transportation Planning Rule. The TPR states that when amendments to a functional plan would significantly affect an existing or planned transportation facility the local government shall put in place measures to assure that the allowed land uses are consistent with the identified function, capacity and performance standards (level of service, volume to capacity ratio, etc.) of the facility. The *2035 TSP* provides an updated, balanced transportation system with amended functions and capacity of the roadways system that will accommodate growth and land uses envisioned by the acknowledged *Metro Plan*.

For the reasons set forth below, the proposed amendments are in compliance with Goal 12. The table below (Findings Table A) provides specific findings discussing compliance with individual sections of the TPR.

TPR Requirements	Compliance
OAR 660-012-0015 Preparation and Coordination of Transportation System Plans	
3) Cities and counties shall prepare, adopt and amend local TSPs for lands within their planning jurisdiction in compliance with this division: (a) Local TSPs shall establish a system of transportation facilities and services adequate to meet identified local transportation needs and shall be consistent with regional TSPs and adopted elements of the state TSP;	Chapter 3 and Appendix A (Existing Conditions) document the existing conditions inventory and analysis. These outline all of the identified needs associated with today's conditions for each mode as well as those intersections and streets not meeting applicable operating standards. Chapter 3 and Appendix B (No Build) document the No Build analysis. These outline all of the identified year 2035 needs assuming no additional infrastructure beyond that currently funded is added. Each mode's needs as well as intersection and streets not meeting applicable standards are noted. Appendix C (20 year Needs Analysis) and Chapters 4 and 5 document the Build analysis. These outline the identified facilities and services needed to meet the identified transportation needs by mode. The *2035 TSP* was prepared in collaboration with ODOT to ensure consistency with the Oregon Highway Plan, with Lane County to ensure consistency with the County TSP, and with LCOG to ensure consistency with *TransPlan* and the Central Lane RTP. The *2035 TSP* has the same horizon year as the federally required Central Lane RTP. Even though the *2035 TSP* and *TransPlan* have different horizon years (2035 for the local TSP and 2027 for the regional TSP), there is no conflict between the population and employment numbers. Table B, below, details the consistency between the *2035 TSP* and *TransPlan*. Additionally, because the transportation policies in the *Metro Plan* are taken verbatim from *TransPlan*, the findings of consistency between the Transportation Element of the *Metro Plan* and the *2035 TSP* further demonstrate consistency between the *2035 TSP* and *TransPlan*.
(b) Where the regional TSP or elements of the	Not applicable. Applicable regional and state plans

state TSP have not been adopted, the city or county shall coordinate the preparation of the local TSP with the regional transportation planning body and ODOT to assure that regional and state transportation needs are accommodated.	have been adopted. Future updates of the RTSP and RTP are being coordinated with this TSP update with ODOT and the Central Lane MPO.
(4) Cities and counties shall adopt regional and local TSPs required by this division as part of their comprehensive plans. Transportation financing programs required by OAR 660-012-0040 may be adopted as a supporting document to the comprehensive plan.	The *2035 TSP* is being adopted as part of the *Metro Plan*. The *Metro Plan* is being amended to add the following Policy F.39 to the Transportation Element: "The Eugene 2035 Transportation System Plan, not including the transportation financing program, is the City of Eugene's local transportation system plan and is included as Appendix E to the *Metro Plan*."
(5) The preparations of TSPs shall be coordinated with affected state and federal agencies, local governments, special districts and private providers of transportation services.	The Project Management Team (PMT), Technical Advisory Committee (TAC), and Transportation Community Resource Group (TCRG), as described in Chapter 1 of the TSP, included representatives of Lane County, Lane MPO, ODOT, ODOT Rail, DLCD, City of Springfield, Lane Transit District, Northwest Natural Gas, Union Pacific Railroad, and Eugene Airport and were part of the TSP development for all required coordination. The Lane ACT, Eugene Area Chamber of Commerce, University of Oregon, private freight interests, Eugene-Springfield Fire/EMS, Eugene Bicycle and Pedestrian Advisory Committee, and the Bethel and 4J public school districts were consulted on multiple occasions during TSP preparation.
(6) Mass transit, transportation, airport and port districts shall participate in the development of TSPs for those transportation facilities and services they provide. These districts shall prepare and adopt plans for transportation facilities and services they provide. Such plans shall be consistent with and adequate to carry out relevant portions of applicable regional and local TSPs. Cooperative agreements executed under ORS 197.185(2) shall include the requirement that mass transit, transportation, airport and port districts adopt a plan consistent with the requirements of this section.	Eugene does not have a port. The Airport Master Plan was previously adopted by Eugene and Lane County as part of the *Metro Plan*; it is adopted and incorporated by reference in the *2035 TSP*. Management staff from the Airport was involved as a TSP Technical Advisory Team member. Lane Transit District, Lane County transit district, was a member of the TSP Technical Advisory Team and a regular participant in the Transportation Community Resource Group (TCRG) public advisory group. City transportation planners, including the TSP project manager, participated regularly in the update of LTD's Long Range Transit Plan. The concepts and definitions of Frequent transit networks (FTN) were coordinated so that the policy direction in the LRTP, TSP, and Envision Eugene ("Key Corridors") was consistent and complementary. The

	corridor planning needs of the TSP and LRTP are being simultaneously implemented by the co-City/LTD managed MovingAhead project. LTD has participated and been influential in the creation of the TSP's transit policies and potential actions.
OAR 660-012-0016 Coordination with Federally-Required Regional Transportation Plans in Metropolitan Areas	
(1) In metropolitan areas, local governments shall prepare, adopt, amend and update transportation system plans required by this division in coordination with regional transportation plans (RTPs) prepared by MPOs required by federal law. Insofar as possible, regional transportation system plans for metropolitan areas shall be accomplished through a single coordinated process that complies with the applicable requirements of federal law and this division. Nothing in this rule is intended to make adoption or amendment of a regional transportation plan by a metropolitan planning organization a land use decision under Oregon law.	Eugene, as a member of the Central Lane MPO, has been a part of the MPO's regional transportation plan (RTP) update process. The *2035 TSP* has been prepared and coordinated with *TransPlan* and the Central Lane RTP. The *2035 TSP* replaces *TransPlan* as the city's local TSP; *TransPlan* will continue to serve as the area's regional TSP until the new RTSP is developed and adopted. The Central Lane MPO has a work plan approved by LCDC for updating its RTSP. The local TSPs of the individual Central Lane MPO agencies are intended to form the basis of the updated RTSP. The City's adoption of the *2035 TSP* is the last local TSP adopted for the Central Lane MPO area.
OAR 660-012-0020 Elements of TSPs	
(1) A TSP shall establish a coordinated network of transportation facilities adequate to serve state, regional and local transportation needs. (2) The TSP shall include the following elements: (a) Determination of transportation needs as provided in OAR 660-012-0030	Chapter 3 and Appendix A (Existing Conditions) document the Existing Conditions Inventory and Analysis. These outline all of the identified needs associated with today's conditions for each mode as well as those intersections and streets not meeting applicable operating standards. Chapter 3 and Appendix B (No Build Analysis) document the No Build analysis. These outline all of the identified year 2035 needs assuming no additional infrastructure beyond that currently funded is added. Each mode's needs as well as intersection and streets not meeting applicable standards are noted. Appendix C (20-year Needs Analysis) and Chapters 4 and 5 document the Build analysis. These outline the identified facilities and services needed to meet the identified transportation needs by mode.

(b) A road plan for a system of arterials and collectors and standards for the layout of local streets and other important non-collector street connections. Functional classifications of roads in regional and local TSP's shall be consistent with functional classifications of roads in state and regional TSP's and shall provide for continuity between adjacent jurisdictions. The standards for the layout of local streets shall provide for safe and convenient bike and pedestrian circulation necessary to carry out OAR 660-012-0045(3)(b). New connections to arterials and state highways shall be consistent with designated access management categories. The intent of this requirement is to provide guidance on the spacing of future extensions and connections along existing and future streets which are needed to provide reasonably direct routes for bicycle and pedestrian travel. The standards for the layout of local streets shall address: (A) Extensions of existing streets; (B) Connections to existing or planned streets, including arterials and collectors; and (C) Connections to neighborhood destinations.	Chapter 4 of the *2035 TSP* sets forth the City's general functional classifications for streets. The City's adopted Design Standards and Guidelines for Eugene Streets, Sidewalks, Bikeways and Accessways (1999) set forth how existing streets can be modified and new streets can be constructed to accommodate the needs of people with disabilities, riding bicycles, riding transit, walking, driving automobiles and moving freight. In the past, most street design standards were primarily oriented toward moving vehicular traffic, providing rudimentary bike lanes and sidewalks for pedestrians. The 1999 Design Standards and Guidelines for Eugene Street, Sidewalks, Bikeways and Accessways, set forth in Appendix H (Volume 2), serves as the City's current mandatory design standards and advisory guidelines for arterial, collector, and local streets, and provide for safe and convenient bike and pedestrian circulation. These Design Standards and Guidelines will need to be updated to incorporate the *2035 TSP* newer guidance on best practices for bicycle and pedestrian facilities. The policies and action items in *2035 TSP* provide guidance for future updates to street standards. As part of the needs analysis, Eugene's Street Classification Map was reviewed in light of the classifications shown in the *Regional Transportation Plan* (*RTP*), the *Oregon Highway Plan* (OHP), and the criteria set forth in the Eugene Arterial and Collector Street Plan (ACSP). This review identified a number of streets that needed a change in classification to ensure consistency between the various plans governing and providing guidance to the operation and construction of streets and roads within the City's UGB. All streets within the UGB need to be classified under the City's criteria. Attachment B to the *2035 TSP* is the 2016 Street Classification Map that updates the street classification map adopted by the City Council in 1999. In addition to the Design Standards and Guidelines for Eugene Streets, Sidewalks, Bikeways & Accessways and the adopted Street Classification Map, the City has previously adopted the following documents that further satisfy this requirement: • Street Right-of-Way Map;

	• Public Improvement Design Standards Manual; • Utility and Right-of-way Permits, Construction Within the Use of the Public Way, Policies and Procedures Manual. Additionally, the City's ACSP, adopted as findings in support of the Design Standards and Guidelines for Eugene Streets, Sidwalks, Bikeways & Accessways, illustrate the extensions of existing streets, connections to existing and planned streets, including arterials and collectors, and connections to neighborhood destinations. Consistent with this previously adopted plan, connections to arterials and state highways remain consistent with designated access management categories. Eugene Code Chapter 9 includes street connectivity requirements to ensure that all of the following are met: (a) Streets are designed to efficiently and safely accommodate emergency fire and medical service vehicles. (b) The layout of a street system does not create excessive travel lengths. (c) The function of a local street is readily apparent to the user through its appearance and design in order to reduce non-local traffic on local residential streets. (d) Streets are interconnected to reduce travel distance, promote the use of alternative modes, provide for efficient provision of utility and emergency services, and provide for more even dispersal of traffic. (e) New streets are designed to meet the needs of pedestrians and cyclists and encourage walking and bicycling as transportation modes. (f) The street circulation pattern provides connections to and from activity centers such as schools, commercial areas, parks, employment centers, and other major attractors. (g) Street design is responsive to topography and other natural features and avoids or minimizes impacts to water-related resources and wildlife corridors. (h) Local circulation systems and land development patterns do not detract from the efficiency of adjacent collector streets or arterial streets which are designed to accommodate heavy traffic. (i) Streets identified as future transit routes should be designed to safely and efficiently accommodate transit

	vehicles, thus encouraging the use of public transit as a transportation mode. (j) Where appropriate, the street system and its infrastructure should be utilized as an opportunity to convey and treat storm water runoff. Policies contained in Chapter 2 of the *2035 TSP* address extensions of existing streets; connections to existing or planned streets, including arterials and collectors, as well as connections to neighborhood destinations. The pedestrian and bicycle projects noted in Chapters 4 and 5 also provide connections to neighborhood destinations. Chapter 5 of the TSP includes the planned roadway facilities and associated costs. The identified roadway facility projects and roadway plan are consistent with state and regional transportation plans.
(c) A public transportation plan which: (A) Describes public transportation services for the transportation disadvantaged and identifies service inadequacies; (B) Describes intercity bus and passenger rail service and identifies the location of terminals; (C) For areas within an urban growth boundary which have public transit service, identifies existing and planned transit trunk routes, exclusive transit ways, terminals and major transfer stations, major transit stops, and park-and-ride stations. Designation of stop or station locations may allow for minor adjustments in the location of stops to provide for efficient transit or traffic operation or to provide convenient pedestrian access to adjacent or nearby uses.	Chapter 2 of the *2035 TSP* includes transit-specific policies and potential action items for transit policies. Appendix J of the *2035 TSP* sets forth the *Lane Transit District Long Range Transit Plan* from which the TSP's transit-related needs, policies and projects were in large part identified. Additionally, Appendix G of the *2035 TSP* sets forth *On the Move: Regional Transportation Option Plan*. Chapter 3 of the *2035 TSP* and Appendix A (Existing Conditions) outline the existing public transportation services and identifies service deficiencies. They also describe existing transit routes, transit ways, terminals and major transfer stations, stops and park-and-ride stations. In addition, they describe intercity bus and passenger rail service and the location of stations and transfer stations. Chapter 4 presents the transit modal element. Based on the needs analysis, the *2035 TSP* focuses on collaboration with LTD to provide service enhancements, capital improvements, and policies that support: • Changes to streets and intersections to facilitate bus movement; • Frequent and reliable transit service, including

	bus rapid transit (*e.g.*, "EmX"-style of transit service) along Key Corridors; • Amenities that also serve pedestrians and people on bikes, and intermodal connections to transit; • Car share and bike share programs that can extend the first and last mile of transit trips; and • Refinements to transit routes and schedules. Additionally, the *2035 TSP* supports Lane Transit District's Frequent Transit Network (FTN), as defined in the Lane Transit District *Long Range Transit Plan*, as a regional initiative to better connect areas of more active development to transit. Chapter 5 of the *2035 TSP* sets forth planned transit facilities and major improvements, including associated costs for all corridor projects.
(d) A bicycle and pedestrian plan for a network of bicycle and pedestrian routes throughout the planning area. The network and list of facility improvements shall be consistent with the requirements of ORS 366.514.	On March 12, 2012, the Eugene City Council accepted the 2012 Eugene Pedestrian and Bicycle Master Plan (PBMP) and directed the City Manager to integrate the PBMP into the *2035 TSP*. The 2012 PBMP is set forth in Appendix F (Volume 2 of the *2035 TSP)*. Consistent with the TPR's requirement that transportation system plans include a bicycle and pedestrian plan for a network of bicycle and pedestrian routes and that transportation system plans be designed to increase transportation choices and reduce reliance on the automobile, the PBMP's goals, key policies, and projects are woven throughout the *2035 TSP* and function as an integral part to making walking and cycling highly convenient. As such, in addition to the *2035 TSP* serving as Eugene's location transportation system plan, the *2035 TSP* also serves as Eugene's bicycle and pedestrian master plan. Chapter 2 of the *2035 TSP* includes bicycle-specific and pedestrian-specific policies and potential action items for both the bicycle and pedestrian policies. Chapter 3 and Appendix A (Existing Conditions) document the Existing Conditions Inventory and Analysis. Chapter 3 and Appendix B (No Build analysis) document the No Build analysis. These outline all of

	the identified year 2035 needs assuming no additional infrastructure beyond that currently funded is added. These outline all of the identified needs associated for pedestrians and bicyclists. Chapter 4 of the *2035 TSP* includes a plan for the bicycle and pedestrian networks. Chapter 5 of the *2035 TSP* includes the planned pedestrian and bicycle facilities and major improvements and associated costs.
(e) An air, rail, water and pipeline transportation plan which identifies where public use airports, mainline and branchline railroads and railroad facilities, port facilities, and major regional pipelines and terminals are located or planned within the planning area. For airports, the planning area shall include all areas within airport imaginary surfaces and other areas covered by state or federal regulations;	Chapter 2 of the *2035 TSP* includes rail, freight, pipeline and air transportation policies and potential action items for those policies. Additionally, the *2035 TSP* explicitly recognizes the Eugene Airport Master Plan (adopted by Eugene and Lane County as part of the *Metro Plan*) as the guiding policy document for airport property development, services, and support infrastructure. The Eugene Airport Master Plan is set forth in Appendix L. Chapter 3 and Appendix A (Existing Conditions) document the Existing Conditions Inventory and Analysis. These outline the identified needs associated with today's conditions for air, rail, water and pipelines. Chapter 3 and Appendix B (No Build analysis) document the No Build analysis. These outline all of the identified year 2035 needs assuming no additional infrastructure beyond that currently funded is added. Chapter 4 of the TSP includes a plan for the air, rail, water, and pipeline networks.
(f) For areas within an urban area containing a population greater than 25,000 persons a plan for transportation system management and demand management;	In 2005, the City adopted *Strategies for Transportation System Management and Operations*. The adopted TDM standards are set forth in Appendix K (Volume 2 of the *2035 TSP)*. These standards provide a mechanism to vary the number of required off-street parking spaces by providing a strategy for reducing vehicle use and parking demand and using benchmarks to measure program effectiveness. The *2035 TSP* expands the use of TDM and TSMO practices beyond parking to help address traffic congestion, fossil fuel

	reduction goals, safety, and the financial burden of travel on individuals. Further, the *2035 TSP* includes a policy to "[p]romote transportation demand management programs along the Key Corridors, in downtown, and near the University of Oregon to coordinate the needs and travel options of multiple businesses and residences for purposes of reducing automobile and freight demand at times of peak congestion. These programs could be staffed by either a public agency, a business association, or by training individuals within the affected businesses and housing to perform this work." Chapter 4 of the TSP includes a Transportation System Management and Operations (TSMO) plan and a Transportation Demand Management (TDM) plan. Eugene, in collaboration with the Central Lane MPO, LTD/ Point2point, and the City of Springfield identified the key programs and services through the *Regional Transportation Options Plan* (RTOP). The *2035 TSP* recognizes the RTOP as the regional guidance for programs that reduce reliance on single-occupancy vehicles. Further details of TSMO and TDM strategies that support the *2035 TSP* are provided in the *Regional Transportation Options Plan,* which is set forth as Appendix G (Volume 2).
(g) Parking plan as provided in OAR 660-012-0045(5)(c).	Chapter 2 of the *2035 TSP* includes parking policies and potential action items for the parking policies. Chapter 4 of the TSP outlines a parking plan. The City of Eugene implemented a parking plan after the adoption of *TransPlan*. That implementation measure including updating the Eugene Code towards accomplish the following: (A) Achieve per capita a 10% reduction in the number of parking spaces over the planning period through a combination of restrictions on development of new parking spaces, allowing shared spaces, and allowing some existing parking spaces to be redeveloped to other uses; (B) Aids in achieving the measurable standards set in *TransPlan* (per OAR 660-012-0035(4)), such as reducing the percentage of non-auto trips, increasing

	transit ridership on congested corridors, and encouraging development in 'nodes' by reducing parking requirements for transit-oriented development within nodal development areas; (C) Providing land use and subdivision regulations setting minimum and maximum parking requirements in appropriate locations, and eliminating off-street parking requirements for automobiles in the downtown core; and (D) Is consistent with demand management programs, transit-oriented development requirements and planned transit service. This *2035 TSP* contains policies encouraging frequent review and updates to existing parking standards (updated per *TransPlan*, 2002) to reflect improved alternatives to driving single-occupant vehicles as these alternatives become available, such as improved transit service, bike facilities, car- and bike-share programs, improved neighborhood walkability, and transportation Demand Management programs.
(h) Policies and land use regulations for implementing the TSP as provided in OAR 660-012-0045.	The *2035 TSP* adoption package include amendments to Eugene's land use code that are needed for the *2035 TSP* to be recognized as the City's local transportation system plan and to adopt new levels of service for the City's roadways. Additionally, the policies and potential actions for implementing the TSP that are set forth in Chapter 2 of the *2035 TSP* identify amendments that could be made to the land use code to further the policies set forth in *2035 TSP.*
(i) Transportation financing program as provided in OAR 660-012-0040.	Chapter 6 of the TSP includes the transportation financing plan, including existing and potential new funding sources and a summary of improvement costs by modal category. Chapter 5 of the TSP provides a detailed listing of cost for each individual improvement project, by mode.
(3) Each element identified in subsections (2)(b) – (d) of this rule shall contain: (a) An inventory and general assessment of existing and committed transportation	Chapter 3 and Appendix A (Existing Conditions) document the Existing Conditions Inventory and Analysis and describe the existing and committed facilities and services by function, type and condition

facilities and services by function, type, capacity and condition. (A) The transportation capacity analysis shall include information on: (i) The capacities of existing and committed facilities; (ii) The degree to which those capacities have been reached or surpassed on existing facilities; and (iii) The assumptions upon which these capacities are based. (B) For state and regional facilities, the transportation capacity analysis shall be consistent with standards of facility performance considered acceptable by the affected state or regional transportation agency; (C) The transportation facility condition analysis shall describe the general physical and operational condition of each transportation facility (e.g., very good, good, fair, poor, very poor). (b) A system of planned transportation facilities, services and major improvements. The system shall include a description of the type or functional classification of planned facilities and services and their planned capacities and performance standards.	for each mode. These outline all of the identified needs associated with today's conditions for each mode as well as those intersections and streets not meeting applicable operating standards. Chapter 3 and Appendix B (No Build analysis) document the No Build analysis. These outline all of the identified year 2035 needs assuming no additional infrastructure beyond that currently funded is added. These present a transportation capacity analysis of the existing and committed roadway system, including streets and intersections consistent with existing city, county, and state standards; in some instances state adoption of alternative mobility standards will be requested through an OHP amendment. This operational analysis describes the degree to which those capacities have been reached or surpassed on existing facilities, and the assumptions upon which these capacities are based. Chapter 4 summarizes the proposed system of existing and planned transportation facilities, services and major improvements, by functional classification, planned capacities and performance standards. The City maintains a separate inventory of street physical conditions. Concurrent with the adoption of the *2035 TSP* are amendments to the Street Classification Map. Chapter 5 of the *2035 TSP* sets forth a system of planned transportation facilities, services and major improvements, including the type or functional classification of the planned facilities and services.
OAR 660-012-0025 Complying with Goals in Preparing TSPs	
(1) Adoption of a TSP shall constitute a land use decision regarding the need for transportation facilities, services and major improvements and their function, mode and general location.	This will happen automatically upon adoption. This requirement is also included in local regulations.
(2) Findings of compliance with applicable statewide planning goals and acknowledged comprehensive plan policies and land use regulations shall be developed in conjunction with the adoption of the TSP.	These findings demonstrate compliance with the applicable statewide planning goals, acknowledged comprehensive plan and land use regulations.
OAR 660-012-0025(3)	
The City may defer decisions regarding	There are three actions that may be considered a

function, general location and mode of a refinement plan if findings are adopted that: (a) Identify the transportation need for which decisions regarding function, general location or mode are being deferred. (b) Demonstrate why information required to make final determination cannot be made available within time for TSP preparation. (c) Explain how deferral does not invalidate the assumptions upon which the TSP is based ore preclude implementation of the remainder of the TSP. (d) Describe the nature of the findings which will be needed to resolve issues deferred to a refinement plan; and, (e) Set a deadline for adoption of a refinement plan prior to initiation of the periodic review following adoption of the TSP.	deferral of a decision regarding function and general location of improvements: the Randy Papé Beltline Facility Plan, future studies for improved access across the Willamette River, and multimodal studies of the Key Corridors. The Randy Papé Beltline Facility Plan identifies probable improvements that warrant further analysis through the NEPA process. The *2035 TSP* adopts the facility plan, as noted in Chapter 5, and incorporates reasonable outcomes for purposes of project costs and financing projections. Construction of the largest component of this project, a new local arterial bridge, cannot commence until the NEPA analysis is completed and the project is adopted by the City Council. The NEPA process cannot be completed within the timeframe of the TSP, in part because the Facility Plan must be adopted in the TSP before the NEPA analysis may commence. Improved crossings of the Willamette River were identified as a potentially desirable solution to several needs (e.g., seismic upgrades, improved connectivity, and congestion relief). Completion of such a study could not be completed within the timeframe of the *2035 TSP* because of the large study area, environmental sensitivity of the riverine environment, need for robust public engagement, and need to gather funding for such a large undertaking. The *2035 TSP* assumptions about traffic function did not rely on any additional river crossings; hence the deferral of a decision about additional river crossings does not invalidate the assumptions upon which the *2035 TPS* is based or preclude implementation of the remainder of the *2035 TPS*. The *2035 TSP* identifies a desire to complete detailed land use and multimodal transportation studies for several "Key Corridors" identified in the Envision Eugene Vision Statement (2012). Such a planning process was begun as a joint project by the City of Eugene and Lane Transit District, dubbed "MovingAhead." The areas covered by these studies are substantial: the development corridors along Highway 99, River Road, Coburg Road, mid-Willamette/30th Avenue, and others. Completion of these studies could not be completed within the timeframe of the TSP. The TSP used estimations for

	corridor performances and costs based on realistic, previously completed corridors with enhances transit service; therefore, the deferral of a decision on specific corridor improvements does not invalidate the assumptions upon which the TSP is based or preclude implementation of the remainder of the TSP. No new findings will be needed to resolve issues deferred to these studies. There is no need to set a deadline for adoption of a plan amendment based on the outcome of these studies because the *2035 TSP* is self-sufficient without the results of these studies.
OAR 660-012-0030 Determination of Transportation Needs	
(1) The TSP shall identify transportation needs relevant to the planning area and the scale of the transportation network being planned including: (a) State, regional and local transportation needs (b) Needs of the transportation disadvantaged (c) Needs for movement of goods and services to support industrial and commercial development planned for, pursuant to Goal 9.	Chapter 3 and Appendix A (Existing Conditions) document the Existing Conditions Inventory and Analysis. These outline all of the identified needs associated with today's conditions for each mode as well as those intersections and streets not meeting applicable operating standards. Chapter 3 and Appendix B (No Build analysis) document the No Build analysis. These outline all of the identified year 2035 needs assuming no additional infrastructure beyond that currently funded is added. Each mode's needs as well as intersection and streets not meeting applicable standards are noted. Chapter 3 and Appendices A and B include a determination of the transportation needs, by mode, related to state, regional and local transportation needs, needs of transportation disadvantaged, and needs for goods movement to support industrial and commercial development. Representatives of ODOT, DLCD, the Eugene Area Chamber of Commerce, the transportation disadvantaged, Eugene Human Rights Commission, homebuilders, rail, air travel, and freight participated in the creation of the *2035 TSP.*
(2) Local governments preparing local TSPs shall rely on the analyses of state and regional transportation needs in adopted elements of the state TSP and adopted regional TSPs.	The TSP has been coordinated with the analyses included in applicable state plans, the *Metro Plan, TransPlan*, and the RTP.

(3) Within UGBs, the determination of local and regional transportation needs shall be based upon: (a) Population and employment forecasts and distributions that are consistent with acknowledged com plan. Forecasts and distributions shall be for 20 years and, if desired, for longer periods; and,	Chapter 3 and Appendix B (No Build Analysis) include population and employment forecasts consistent with the *Metro Plan* and coordinated with the Lane MPO for year 2035. The *2035 TSP* addresses the projects, programs, and policies needed to support growth in population and jobs within the Eugene UGB between now and the year 2035. The *2035 TSP* defines the transportation facilities needs within Eugene's adopted UGB, as established by the *Metro Plan*. The needs assessment and resulting projects (set forth in Chapter 4 of the *2035 TSP*) establish a transportation system adequate to meet the identified local transportation needs based upon the land use designations established by the *Metro Plan.* Because the *2035 TSP* is based on the *Metro Plan* land use designations, any zone allowed within the land use designation is consistent with both the *Metro Plan* and this *2035 TSP.* Regarding the population and employment forecasts, the determination of the City's needs assumes that the City will continue to see growth in employment and population between now and the year 2035 in a manner consistent with the existing Comprehensive Plan land use designations, within the existing Urban Growth Boundary (UGB) and consistent with the growth forecast adopted into the *Metro Plan.* Regarding the population and employment distributions, Staff from the cities of Eugene and Springfield, Lane County and Lane Council of Governments (LCOG) worked collaboratively to identify where the estimated year 2035 population and employment growth might occur within the region as well as within individual areas of each city. This interagency collaboration ensures that the needs analyses for Eugene, Springfield, and Coburg start with the same fundamental assumptions and that the population and employment forecasts are "coordinated" for compliance with Oregon transportation and land use planning requirements. This growth was allocated to developable areas within the current UGB consistent with the land use designations shown in the adopted *Metro Plan*.

(b) Measures adopted pursuant to OAR 660-012-0045 to encourage reduced reliance on the automobile.	OAR 660-012-0045(1) requires local government to amend its land use regulations to implement the TSP. Eugene's land use regulations were amended to comply with this rule after *TransPlan* was adopted in 2002. The *2035 TSP* retains those measures and encourages incremental changes to strengthen their effectiveness over time as new travel options become available. Modal Targets are identified in the goals contained in Chapter 2; they triple the percentage of trips made by non-auto modes. Many of the goals, policies, and implementing actions contained in Chapter 2 will help reduce reliance on the automobile. The modal plans, TDM and TSMO plans contained in Chapter 4 and the pedestrian, bicycle, and transit improvement projects contained in Chapter 5 will help reduce reliance on the automobile.
(4) In MPO areas, calculation of local and regional transportation needs also shall be based on accomplishment of the requirement in OAR 660-012-0035(4) to reduce reliance on the automobile.	As discussed in more detail under 0035(4), the *2035 TSP* supports and advances the alternative performance standards approved by LCDC in 2001 and adopted as part of *TransPlan*. In furthering the goals of the 2001 standards, the *2035 TSP* builds upon the lessons learned since 2001, and recognizes that there are new, innovative ways to decrease vehicle miles of travel. Embedded in the needs analysis for the *2035 TSP* is the furtherance of the City's adopted measures that will reduce reliance on the automobile. The *2035 TSP* reflects Eugene policy makers' and community members' priority to maintain existing facilities and provide multiple transportation options for local and regional travel. These priorities are based on the premise that the City can reduce congestion, save money, and provide health benefits for the entire community by providing alternatives to single occupancy vehicle travel and by making existing streets safer and more efficient without costly increases to automobile-oriented infrastructure. The *2035 TSP* supports the land use strategies defined in the *2012 Envision Eugene, A Community Vision for 2032* and prioritizes recommendations that mitigate the strain on roadways by supporting transit service

	and making walking and bicycling trips more practical for working, shopping, and other daily activities; managing congestion; and improving safety. The *2035 TSP* goals, policies, projects, and potential implementing actions are based on analysis by, and input received from, the community, City of Eugene staff, partner agency staff, and City policy-makers. Their review included analysis of, among other things, a multi-step evaluation of the "triple bottom line" (economy, social equity, and natural environment) that included considerations of how possible system improvements will meet the transportation needs for all modes, address the needs of the transportation disadvantaged, and address the need for movement of goods and services to support industrial and commercial development.
OAR 660-012-0035 Evaluation and Selection of Transportation System Alternatives	
(1) The TSP shall be based on evaluation of potential impacts of system alternatives that can reasonably be expected to meet the identified transportation needs in a safe manner and at a reasonable cost with available technology. The following shall be evaluated as components of system alternatives.	The multimodal system improvements were assessed against the goals and policies in Chapter 2 and the evaluation criteria in Chapter 3 to ensure that needs are met with a safe and reasonable manner with available technology.
(a) Improvements to existing facilities or services;	Improvements to existing facilities and services are the fundamental basis and highest priority of the TSP goals, policies and project lists. As iterated in the policies in Chapter 2, the City's priority is to improve system efficiency, safety and management and re-purpose existing rights-of-way to include high-quality facilities for non-auto users before widening streets to expand capacity for motorized vehicles. Specifically, the *2035 TSP*'s Cost Effectiveness and Finance Policy 2, states: "Maintain transportation performance and improve safety by improving system efficiency and management before adding capacity for automobiles to the transportation system by using the following priorities for developing the Eugene Capital Improvement Program (CIP) and Eugene projects in the Metropolitan Transportation Improvement Program (MTIP): a. <u>Protect the existing system</u>. The highest

	priority is to preserve or improve the functionality of the existing transportation system by means such as access management, transportation demand management, improved traffic operations, technologies, accommodating "active transportation" options not previously present, and keeping roads well maintained to avoid reconstruction. b. Improve the efficiency and safety of existing facilities. The second priority is to make minor improvements to existing streets, such as adding turning lanes at intersections, providing and enhancing pedestrian, bicycle and transit facilities, and extending or connecting streets pursuant to existing plans. c. Add capacity to the existing system. The third priority is to make major improvements to existing transportation facilities such as adding general purpose lanes and making alignment corrections to accommodate legal-sized vehicles. d. Add new facilities to the system. The lowest priority is to add new transportation facilities for motorized vehicles, such as new roadways. New streets that are needed and planned for connectivity are a higher priority, as noted in (b), above." In accordance with Appendices A (Existing Conditions), B (No Build), and C (20-year Needs Analysis), improvements to the existing facilities and services were examined through the existing conditions study, needs analysis with a "No Build" scenario, and a scenario that explored improvements and additions to the existing system. Technological and TSMO improvements to the efficiency of the existing system are recommended by the TSP.
(b) New facilities and services, including different modes or combinations of modes that could reasonably meet identified transportation needs.	All new facilities identified in Chapters 4 and 5 were evaluated in their ability to provide for "Complete Streets" and facilities and improvements that increase transportation choices, reduce reliance on the

	automobile, and improve safety. The reasonableness of proposed projects were verified by the following selection criteria (Chapter 3): 1. Is it technically feasible to build this project? 2. Could the project be funded? 3. Could the project receive necessary environmental permits? Potential projects failing these criteria were dropped from the TSP or deferred for future study (i.e., the Randy Papé Beltline Facility Plan, which had already been deemed reasonably feasible).
(c) Transportation system management measures;	The Transportation System Management and Operations (TSMO) Plan, contained in Chapter 4, focuses on increasing the safety and efficiency of the existing street system, promoting safety for all users, supporting the economy and supporting the City's Climate Recovery Ordinance.
(d) Demand management measures; and	The Transportation Demand Management (TDM) Plan, contained in Chapter 4, in coordination with the Regional Transportation Options Plan (RTOP), focus on providing greater travel choices to enhance mobility and accessibility and maximize transportation investments. Transportation Demand Management is a tool already integrated into the Eugene Land Use Code for reducing demand on a facility, reliance on single-occupant motorized vehicles, and parking supply. Further, the city has set targets to triple the percentage of trips made by trips other than the automobile by 2035.
(e) A no-build system alternative required by the NEPA or other laws.	Chapter 3 and Appendix B (No Build) document the No Build system alternative and associated transportation needs in the year 2035.
(3) The following standards shall be used to evaluate and select alternatives:	Chapter 3 and Appendix D (Alternatives Evaluation Process) document the alternatives evaluation and selection process. Goals and policies are included in Chapter 2 and guided the process. The evaluation framework developed for the TSP referenced the Sustainable Transportation Analysis and Rating System (STARS) and reflects the city's commitment to the sustainability triple bottom line. The STARS evaluation

	framework, although more robust, satisfies the TPR requirements as noted below. (TSP Table 3.2)
(a) The transportation system shall support urban and rural development by providing types and levels of transportation facilities and services appropriate to serve the land uses identified in the acknowledged comprehensive plan;	The *2035 TSP* modeling and needs analysis is based on the Comprehensive Plan land use designations in the *Metro Plan* within the existing UGB and consistent with the growth forecast adopted into the *Metro Plan.* Modeling for the *2035 TSP* used the same land use designation model (or "layer") used for the Envision Eugene buildable lands inventory. Because the *Metro Plan* land use designation map was adopted at a relatively large scale (small geographic representation) of 1:1,500, and no file is maintained by the City of known plan-split lots as is the case for zoning districts, the land use designation layer was created by enlarging the *Metro Plan*'s 11x17 land use designation map and applying a set of rules to resolve split designations on taxlots. A process was used to identify those lots having a substantive portion in two or more differing plan designations versus those that have only a minor portion in an adjoining plan designation. Those lots not identified as candidate split lots were considered designated according to the plan designation found at the geometric center of the lot. Chapter 3 and Appendices B (No Build) and C (20 year Needs Analysis) document the anticipated land uses and the *2035 TSP* projects (types and levels of service) needed to support the land uses depicted on the land use designation layer described above. The TSP supports urban growth as planned for the Eugene UGB area in the acknowledged comprehensive plan (the *Metro Plan*) and regional travel, and restricts facility extension that might encourage inappropriate growth on rural lands. Comparable STARS criteria: • Ensure consistency between transportation investments and all relevant adopted and accepted local plans. • Support redevelopment priorities by promoting compatible transportation investments along key corridors and in core commercial areas, including downtown. • Increase access to employment centers via foot, bike, and transit, while improving the

	quality of the traveling experience.
(b) The transportation system shall be consistent with state and federal standards for protection of air, land and water quality;	Three of the eight STARS evaluation criteria reference air quality, protection of land and water quality. All alternatives considered were evaluated against adopted state and federal standards. Sample STARS criteria that promote consistency with state and federal standards for protection of air, land and water quality: • Support the reduction in quantities of harmful airborne pollutants associated with transportation.
(c) The transportation system shall minimize adverse economic, social, environmental and energy consequences;	The alternatives analysis summarized in Chapter 3 and Appendix D (Alternatives Evaluation Process) include an evaluation of adverse economic, social, environmental and energy consequences. Many of the eight evaluation criteria reference these issues. Further, the goals and policies included in Chapter 2 highlight the importance of minimizing these consequences. Example STARS criteria that minimize adverse economic, social, environmental and energy consequences: • Use future transportation investments to reduce or eliminate disparities between neighborhoods in access, economic benefits, safety, and health. • Encourage infrastructure and programs that allow residents to reduce expenditures on fuel and vehicle use. • Focus on transportation programs and projects that help to: o reduce total community-wide fossil fuel use by 50% by 2030 o reduce vehicle miles traveled per capita by 10% by the year 2020 o reduce community-wide greenhouse gas emissions 10% below 1990 levels by 2020 Triple Bottom Line (abbreviated as TBL) is an accounting framework with three parts: social, environmental, and financial. The *2035 TSP* integrated

	TBL sustainability principles in every step of its development. The criteria that were used to prioritize potential projects and programs in this plan were broadened to include public health and safety, community context and neighborhood character, climate and energy, and cost effectiveness to ensure that the plan adequately addresses the many aspects of the economy-equity-environment triple bottom line. The *2035 TSP* supports equity and social prosperities in several ways. This plan supports the provision of complete transportation networks that serve all travelers of all ages, abilities, and incomes. Everybody should have safe and efficient access to employment, education, services, and recreation. The *2035 TSP* promotes the services and projects that will result in sufficient options to meet these needs. This plan also calls for assurances that costs and benefits of transportation improvements are shared equitably over time, both geographically throughout the city and among populations of different economic strata, races, and ethnicities. The *2035 TSP* supports the continued growth and vitality of the local and regional economy. Transportation infrastructure investments on key corridors will support the projected employment base and freight movements as well as improve multimodal access to the airport and train station. The *2035 TSP* removes a barrier to planned growth by adjusting Levels of Service for traffic to more realistic levels, levels that reduce reliance on automobile travel and permit levels of development desired by the comprehensive land use plan.
(d) The transportation system shall minimize conflicts and facilitate connections between modes of transportation; and	The alternatives analysis summarized in Chapter 3 and Appendix D (Alternatives Evaluation Process) include an evaluation of the potential for intermodal connections and minimization of conflicts. Further, the goals and policies included in Chapter 2 are focused on creating a complete, connected transportation system that meets the needs and safety of travelers of all ages, abilities, races, ethnicities and incomes. Sample STARS criteria that minimize conflicts and facilitate connections between modes of transportation:

	• Support redevelopment priorities by promoting compatible transportation investments along key corridors and in core commercial areas, including downtown. • Foster neighborhoods where 90 percent of Eugene residents can meet most daily needs without relying heavily on an automobile. • Improve the comfort and convenience of travel, especially for walking, bicycling, carpooling, and riding transit. • Maintain a network of Emergency Response Streets to facilitate prompt emergency response.
(e) The transportation system shall avoid principal reliance on any one mode of transportation by increasing transportation choices to reduce principal reliance on the automobile. Select transportation alternatives that meet the requirements in section (4) of the rule.	The alternatives analysis summarized in Chapter 3 and Appendix D (Alternatives Evaluation Process) is fundamentally based on the need to decrease reliance on the automobile (see sample criteria, above). Most of the eight STARS evaluation criteria reference this critical need. Further, the goals and policies included in Chapter 2 highlight the importance of tripling the percentage of trips made by transit, cycling and walking by 2035 and increasing transportation choices for all users. The *2035 TSP* plans for significant investment in active transportation over the next 20 years. Of the 276 projects planned in the *2035 TSP* to be built over the next 20 years, 253 of the projects are entirely pedestrian and bicycle projects; those projects include 89 neighborhood greenway projects, 17 shared use paths, 10 protected bike lane projects, and 89 separated path/sidewalk projects. Six of the 276 projects are transit projects, which include improving frequent transit service and multimodal travel along numerous transit corridors. The *2035 TSP* includes a "Complete Streets" policy that will affect how all streets will be planned and maintained in the future. By making streets more inviting to pedestrians and bicyclists, especially for short trips, the City will gain more efficient use of limited available space within the street rights-of-way, provide a healthier environment in neighborhoods, and support the higher density, mixed use Key Corridors championed by the *Envision Eugene, A*

	Community Vision for 2032. Improvements to the sidewalk, bicycle, and transit networks make many more travel options available, providing choices that best fit one's travel needs, financial situation, and location. In furtherance of the goal to increase the number of people choosing active transportation as their travel option, as noted above, there are 245 bicycle, pedestrian and transit projects planned for the next 20 years; these projects representing over 51% of the total transportation dollars that the City plans to spend over the next 20 years. By planning for the active transportation infrastructure that will make active modes of travel more safe and convenient, the *2035 TSP* is designed to achieve its goal of greatly increasing the number of trips made by transit, bicycling and walking. With the 245 bicycle, pedestrian and transit projects (as well as the six complete street projects) planned for the next 20 years, the *2035 TSP* hopes to (at least) triple the number of trips made by transit, bicycling or walking by 2035.
(4) In MPO area, regional and local TSPs shall be designed to achieve adopted standards for increasing transportation choices and reducing reliance on the automobile. Adopted standards are intended as means of measuring progress of metropolitan areas towards developing and implementing transportation systems and land use plans that increase transportation choices and reduce reliance on the automobile. It is anticipated that metropolitan areas will accomplish reduced reliance by changing land use patterns and transportation systems so that walking, cycling, and use of transit are highly convenient and so that, on balance, people need to and are likely to drive less than they do today.	The *2035 TSP* supports and advances the alternative performance standards approved by LCDC in 2001 and adopted as part of *TransPlan*. The Transportation Demand Management Plan, contained in Chapter 4, in coordination with the Regional Transportation Options Plan, focuses on providing greater travel choices to enhance mobility and accessibility and maximize transportation investments. Further, the City has set targets to triple the percentage of trips made by trips other than the automobile by 2035, as iterated in the goals and policies included in Chapter 2 and the evaluation criteria included in Chapter 3. In furthering the goals of the 2001 standards, the *2035 TSP* builds upon the lessons learned since 2001, and recognizes that there are new, innovative ways to decrease vehicle miles of travel. To that end, the *2035 TSP* uses terminology that, at times, slightly differs from the terminology adopted in 2001, but nevertheless advances the achievement of the standards approved by LCDC in 2001. For example, the City no longer uses the term "nodal development" in its land use and transportation planning efforts.

	Instead, the City uses terms such as "key corridors" and "20-minute neighborhoods." Despite a shift in terminology, the underlying concept, goals, and benefits of nodal development remains unchanged; providing land use patterns so that walking, cycling, and use of transit are highly convenient and so that, on balance, people need to and are likely to drive less than they do today. Most importantly, the *2035 TSP* is designed to increase transportation choices and reduce reliance on the automobile. The *2035 TSP* supports and advances the alternative performance standards approved by LCDC in 2001 and adopted as part of *TransPlan* in the following way: **% Non-Auto Trips**. The *2035 TSP* has goals of tripling trips by walking, biking, and transit and reducing fossil fuel consumption. Of the 264 projects planned in the *2035 TSP* to be built over the next 20 years, 239 of the projects are entirely pedestrian and bicycle projects; those projects include 89 neighborhood greenway projects, 18 shared use paths, 12 protected bike lane projects, and 85 separated path/sidewalk projects. Six of the 264 projects are transit project, which include improving frequent transit service and multimodal travel along numerous transit corridors. These 245 bicycle, pedestrian, and transit projects represent 51% of the total transportation dollars that are planned to be spent over the next 20 years. Of the 19 remaining projects, six of the projects are complete street upgrades to existing roadways; all six of these projects have a significant bicycle and pedestrian component. These complete street projects represent an additional 10% of the total transportation dollars. Establishment of a bike share program is currently underway and is one of the *2035 TSP*'s four bicycle policies. The *2035 TSP* has a policy to encourage walking as the most attractive mode of transportation for short trips (*e.g.*, within .5 miles) within and to activity centers, downtown, key corridors, and major destinations, and as a means of accessing transit. A related policy of the *2035 TSP* is to ensure that there are safe, accessible, comfortable, and direct sidewalk connections between residential areas, major destinations, and transit stops and to continually improve walking comfort, safety, and accessibility through design, operations, retrofits, and maintenance.

	% Transit Mode Share on Congested Corridors. The *2035 TSP* has a goal of tripling trips by walking, biking, and transit, and policies that promote planning and improving multimodal access along the Key Corridors (EE Vision) and (the same) Frequent Transit Networks (LTD Long Range Transit Plan). The *2035 TSP* policies promote improved transit services that are integrated through context specific multimodal planning for all Key Corridors. One of the four transit policies in the *2035 TSP* is to collaborate with Lane Transit District to provide a network of high capacity, frequent, and reliable transit services, including consideration of Bus Rapid Transit, to the City's identified Key Corridors and to Frequent Transit Corridors as defined by Lane Transit District's Long Range Transit Plan. Additionally, the *2035 TSP* includes $171.4 million in transit projects that support the transit policies and the identified transit needs. The six multimodal/transit projects planned for the next 20 years include the improvement of frequent transit service and multimodal travel along Coburg Road, River Road, Highway 99, 30th Avenue and Amazon Parkway, new transfer stations, and enhanced pedestrian crossings. Additionally, an identified potential action item is to review City Code and amend it if needed to enable additional opportunities to provide bikeways and improved pedestrian connections between key destinations, transit stops, and residential areas with new development and redevelopment. **Priority Bikeway Miles**. "Priority bikeway" projects are defined in *TransPlan* as: "Bike projects located along an essential core route on which the overall bicycle system depends; *and* (one of the following): 1. Fills in a critical gap in the existing bicycle system; or 2. Overcomes a barrier where no other nearby existing or programmed bikeway alternatives exist; or, 3. Significantly improves bicycle users' safety in a given corridor." The *2035 TSP* sets benchmarks constructing new projects that meet *TransPlan*'s definition of Priority Bikeway Miles. The *2035 TSP* promotes a complete network of various context sensitive bikeways throughout the community (including cycle tracks, bike boulevards, and protected bikeways). As discussed above, of the 264 projects planned in the

	2035 TSP to be built over the next 20 years, 245 of the projects are entirely pedestrian and bicycle projects; those projects include 89 neighborhood greenway projects, 22 on-street bike lanes, 18 shared use paths, 12 protected bike lane projects, and 85 separated path/sidewalk projects. These 245 bicycle, pedestrian, and transit projects represent 51% of the total transportation dollars that are planned to be spent over the next 20 years. One of the *2035 TSP*'s bicycle policies is to "[d]evelop a well-connected and comfortable bikeway network. Ensure that there are safe, comfortable, and direct bikeway connections between residential areas, major destinations, and transit stops and provide secure bicycle parking facilities at these destinations." The related potential action item is: "Maintain a map and project list for desired improvements to the bicycle network within the life of this plan. Provide priorities among these projects, yet provide flexibility among priorities to respond to unforeseen opportunities and development." The list of bicycle projects in support of the policies and the identified needs are shown in Chapter 5. The *2035 TSP* is the City's bicycle and pedestrian plan, providing projects and policies that will create a network of bicycle and pedestrian-friendly routes throughout the planning area. While the map of all potential bicycle system improvements may include some on local streets, only improvements on collector and arterial streets were considered for the *2035 TSP* project list and cost estimates. **Acres of zoned nodal development**. "Nodal development" is defined in *TransPlan* as "a mixed-used, pedestrian friendly land use pattern that seeks to increase concentrations of population and employment in well-defined areas with good transit service, a mix of diverse and compatible land uses, and public and private improvements designed to be pedestrian and transit oriented." The *2035 TSP* promotes the completion of safe, comfortable, and direct sidewalk and bikeway networks between key destinations, transit stops, and residential areas, which supports nodal development. Specifically, the *2035 TSP* does not change the zoning of nodal development areas. Further, the *2035 TSP* sets benchmarks for increasing the number of acres that meet *TransPlan*'s

	definition of nodal development, *i.e*., mixed use centers, Key Transit Corridors, and 20-minute neighborhoods. **% of dwelling units built in nodes**. This TSP promotes neighborhoods where 90 percent of Eugene residents can meet most daily needs without relying heavily on an automobile. A system-wide policy of the *2035 TSP* is fostering neighborhoods where Eugene residents can meet most of their basic daily needs without an automobile by providing streets, sidewalks, bikeways, and access to transit in an inviting environment where all travelers feel safe and secure. The related potential action item is the creation of a strategy to facilitate 90 percent of Eugene residences to be within 20-minute neighborhoods. Further, the *2035 TSP* sets benchmarks for increasing the percentage of new dwelling units built in areas that meet *TransPlan's* definition of nodal development, *i.e*., % of new dwelling units built in mixed use centers, 20-Minute Neighborhoods, and along Key Transit Corridors. **% of New "Total" Employment in Nodes**. The TSP supports employment in nodes by increasing access to employment centers via foot, bike, and transit, and promoting compatible transportation investments along key corridors and in core commercial areas, including downtown. Identified potential action items include aligning the City's land use and parking regulating to encourage walking, biking, and use of public transit and periodically reviewing parking needs in the downtown, Federal Courthouse, and riverfront districts and balance supply with other objectives, such as economic vitality; support for transit, walking, and biking; reduced consumption of fossil fuels; and human-scaled urban form. Additionally, for more than 10 years the City has had in place *Standards for Transportation Demand Management Programs* that provide a mechanism to vary the number of required off-street parking spaces by providing a strategy for reducing vehicle use and parking demand and using benchmarks to measure program effectiveness. Further, the 2035 TSP sets aggressive goals for the percentage of new employment located within areas that meet *TransPlan*'s definition of nodal development, *i.e.*, % of new employment in mixed use centers, 20 Minute Neighborhoods, and along Key Transit Corridors.

	Internal VMT. Vehicle Miles Travelled have been on the decline in Eugene. Policies cited above that promote alternatives to driving, mixed use neighborhoods, and reduced consumption of fossil fuels will help reduce VMT. Goal 1 of the *2035 TSP* is to "[c]reate an integrated transportation system that is safe and efficient; supports the *Metro Plan*'s land use diagram and *Envision Eugene, A Community Vision for 2032* (2012), the City of Eugene's target for a 50 percent reduction in fossil fuel consumption, and other City land use and economic development goals; reduces reliance on single-occupancy automobiles; and enhances community livability." **VMT/Capita**. Per capita VMT has been on the decline in Eugene. Policies cited above that promote alternatives to driving, mixed use neighborhoods, education, and reduced consumption of fossil fuels will help reduce per capita VMT. The *2035 TSP*'s design to increase transportation choices and reduce reliance on the automobile will most likely advance any new regional standards that are adopted as part of the RTSP update, however, if needed, the *2035 TSP* will be amended to address the new regional standards.
(7) Regional and local TSPs shall include benchmarks to assure satisfactory progress towards meeting the approved standard or standards adopted pursuant to this rule at regular intervals over the planning period. MPOs and local governments shall evaluate progress in meeting benchmarks at each update of the regional transportation plan. Where benchmarks are not met, the relevant TSP shall be amended to include new or additional efforts adequate to meet the requirements of this rule.	As discussed above, OAR 660-012-0035(5) requires that MPO areas adopt standards for approval by the Land Conservation and Development Commission (LCDC). The 0035(5) standards developed by the Eugene-Springfield MPO for *TransPlan* were approved by LCDC in 2001, and adopted as part of *TransPlan* in 2002. Because *TransPlan* remains the metro area's regional transportation system plan, the standards adopted by LDCD in 2001 are still in effect, and applicable, today. Therefore, the *Eugene 2035 TSP* retains the LCDC-approved standards as required by the TPR and sets forth benchmarks that advance progress towards increasing transportation choices and reducing reliance on the automobile, and better reflect local targets for bicycle, walking, and transit travel and achieving the land use patterns promoted by *Envision*

	Eugene, A Community Vision for 2032. Attachment D to the *2035 TSP* sets forth benchmarks to assure that the City is making satisfactory progress towards meeting the standards approved by LCDC in 2001. The benchmarks in Attachment D include regular intervals over the *2035 TSP*'s 20-year planning for the City to evaluate its progress toward meeting the Alternatives Performance Measures approved by LCDC in 2001 for the Eugene-Springfield MPO.
(10) Transportation uses or improvements listed in OAR 660-012-0065(3)(d) to (g) and (o) and located in an urban fringe may be included in a TSP only if the improvement project identified in the Transportation System Plan as described in section (12) of this rule, will not significantly reduce peak hour travel time for the route as determined pursuant to section (11) of this rule, or the jurisdiction determines that the following alternatives can not reasonably satisfy the purpose of the improvement project: (a) Improvements to transportation facilities and services within the urban growth boundary; (b) Transportation system management measures that do not significantly increase capacity; or (c) Transportation demand management measures. The jurisdiction needs only to consider alternatives that are safe and effective, consistent with applicable standards and that can be implemented at a reasonable cost using available technology.	The *2035 TSP* includes Project No. MM-3: "Construct local arterial bridge over the Willamette River to the north of the Beltline Highway, connecting Division Avenue to Green Acres Road; construct operational improvements to existing Randy Papé Beltline Highway/Delta Highway ramps consistent with the Beltline Highway Facility Plan." Additionally, the Randy Papé Beltline Facility Plan is adopted as part of the *2035 TSP* (Attachment C). The Facility Plan includes recommended improvements to the Randy Papé Beltline Highway, Delta Highway and adjacent arterial street system to improve safety and the long-term operations of the highway between River Road and Coburg Road. This Facility Plan is a precursor to the National Environmental Policy Act (NEPA) process for the implementation of future Randy Papé Beltline Highway projects. The NEPA analysis will include more detailed and rigorous analysis of project impacts and result in a determination as to whether or not one or more of the improvements options can be constructed and, potentially, result in a recommended preferred project that is eligible for federal funding. If the outcome of the NEPA analysis is that one or more of the improvement options can be constructed, the project description and costs estimates for Project MM-3 will be updated to reflect the improvement option ultimately selected. The City recognizes that construction outside of the urban growth boundary may require a goal exception or UGB amendment. Those land use issues will be resolved together with Lane County. Nevertheless, MM-3 (which may include construction within the urban fringe) can be included in the *2035 TSP* because the project is authorized by provisions of OAR 660-012-0065 other than (3)(d) to (g) and (o).
OAR 660-012-0040 Transportation Financing Program	

(1) For areas within an urban growth boundary containing a population greater than 2,500 persons, the TSP shall include a transportation financing program.	Cost estimates for all of the planned facilities and major improvements (i.e., "projects") are included in Chapter 5. Chapter 6 contains a summary of all project costs, by prioritization category, a projection of revenue and a financing and implementation plan.
(2) A transportation financing program shall include the items listed in (a)-(d):	The TSP contains all the required components of the -0040(2) finance plan: (d) policies to guide selection of transportation facility and improvement projects for funding in the short-term to meet the standards and benchmarks established pursuant to 0035(4)-(6). The policies, contained in Chapter 2, consider and include facilities and improvements that support mixed-use, pedestrian friendly development and increased use of alternative (non-automobile) modes of transportation.
(a) A list of planned transportation facilities and major improvements;	Chapter 5 lists all of the planned transportation facilities and major improvements, by mode.
(b) A general estimate of the timing for planned transportation facilities and major improvements;	All of the planned transportation facilities and major improvements are contained in Chapter 5 and are prioritized in the following categories for general timing: projects within 20 years, projects to complete upon development of adjacent lands, projects that could be completed beyond the 20-year planning horizon if conditions change and the TSP is amended, and projects requiring further study prior to establishing a timing for funding and implementation.
(c) A determination of rough cost estimates for the transportation facilities and major improvements identified in the TSP; and	Chapter 5 lists all of the planned transportation facilities and major improvements, by mode and their associated cost estimates.
(d) In metropolitan areas, policies to guide selection of transportation facility and improvement projects for funding in the short-term to meet the standards and benchmarks established pursuant to 0035(4)-(6). Such policies shall consider, and shall include among the priorities, facilities and improvements that support mixed-use, pedestrian friendly	The *2035 TSP* articulates policies and actions that explicitly prioritize facilities and improvements that support mixed-use, pedestrian friendly neighborhoods, increase use of active modes of transportation, and reduce reliance on travel by single-occupant automobile. These priorities include improved convenience and safety for walking, biking, and connections to transit stops; improved transit service

development and increased use of alternative modes.	in Key Corridors; bikeway improvements near the University of Oregon, downtown Eugene, and on streets connecting residential areas to schools and commercial hubs; a railroad quiet zone in the downtown and Whiteaker areas; investments that facilitate job growth in high priority employment opportunity sites; and priority parking and reduced parking fees for non-gasoline powered vehicles. Goal 1 of the *2035 TSP* states: "Create an integrated transportation system that is safe and efficient; supports the *Metro Plan*'s land use diagram and *Envision Eugene, A Community Vision for 2032* (2012), the City of Eugene's target for a 50 percent reduction in fossil fuel consumption, and other City land use and economic development goals; reduces reliance on single-occupancy automobiles; and enhances community livability." The *2035 TSP* contains many policies that prioritize facilities and improvements that support mixed-use, pedestrian friendly development and increased use of alternative modes, including the following: Roadway Policy 1: "Design, construct, maintain, and operate all streets to provide comprehensive and integrated transportation networks that serve people of all ages and abilities, promote commerce, and support the comprehensive land use plan's vision for growth and development in a responsible and efficient manner. A "complete street" allows safe travel for automobiles and emergency responders, bicycles, walking, transit, and freight. In addition to fulfilling a street's basic transportation functions and providing access to properties, streets and sidewalks should be designed to be attractive, safe, accessible, sustainable, and healthy components of the City's environment." Pedestrian Policy 1: "Encourage walking as the most attractive mode of transportation for short trips (*e.g.*, within .5 miles) within and to activity centers, downtown, key corridors, and major destinations, and as a means of accessing transit." Pedestrian Policy 3: "Coordinate improvements to complement and improve the systems proposed in the Eugene Trails Plan and connections to regional trails." Bicycle Policy 2: "Develop a well-connected and

	comfortable bikeway network. Ensure that there are safe, comfortable, and direct bikeway connections between residential areas, major destinations, and transit stops and provide secure bicycle parking facilities at these destinations."
(3) The determination of rough cost estimates is intended to provide an estimate of the fiscal requirements to support the land uses in the acknowledged comprehensive plan and allow jurisdictions to assess the adequacy of existing and possible alternative funding mechanisms. In addition to including rough cost estimates for each transportation facility and major improvement, the transportation financing plan shall include a discussion of the facility provider's existing funding mechanisms and the ability of these and possible new mechanisms to fund the development of each transportation facility and major improvement. These funding mechanisms may also be described in terms of general guidelines or local policies.	Chapter 5 lists all of the planned transportation facilities and major improvements, by mode and their associated cost estimates. Chapter 6 includes a summary of cost estimates, by prioritization category, a forecast of revenue based on existing funding mechanisms and potential new mechanisms, and a plan for implementation. Additionally, Chapter 2 includes policies and potential action items specific to cost effectiveness and finance. The planning level cost estimates provided in Chapter 5 of the *2035 TSP* provide an estimate of the fiscal requirements to support the land uses in the acknowledged comprehensive plan and allow the assessment of the adequacy of existing and alternative funding mechanisms. The transportation financing plan (Chapter 6) includes a discussion of the facility provider's existing funding mechanisms and the ability of these and possible new mechanisms to fund the development of each transportation facility and major improvement.
(5) The transportation financing program shall provide for phasing of major improvements to encourage infill and redevelopment of urban lands prior to facilities and improvements which would cause premature development of urbanizable lands or conversion of rural lands to urban uses.	The planned transportation facilities and major improvements identified in Chapter 5 prioritize pedestrian, bicycle, and transit improvements in Key Corridors that encourage infill and redevelopment. A system-wide policy of the *2035 TSP* is fostering neighborhoods where Eugene residents can meet most of their basic daily needs without an automobile by providing streets, sidewalks, bikeways, and access to transit in an inviting environment where all travelers feel safe and secure. The related potential action item is the creation of a strategy to facilitate 90 percent of Eugene residences to be within 20-minute neighborhoods. The *2035 TSP* also supports the land use strategies defined in the *2012 Envision Eugene, A Community Vision for 2032* and prioritizes recommendations that mitigate the strain on roadways by supporting transit service and making walking and bicycling trips more

	practical for working, shopping, and other daily activities; managing congestion; and improving safety. One primary focus of both the *Metro Plan* and *Envision Eugene* is on more compact development. As such, significant future residential development is likely to occur in the Downtown and "Key Corridors" (see Volume 2, Appendix E), including: Willamette Street, W 11th Avenue, Highway 99N, River Road, Coburg Road, and Franklin Boulevard. The *2035 TSP* includes projects and programs, and identifies financial resources, that support the growth anticipated over the next 20 years along these key corridors. The transportation financing program (Chapters 5 and 6) provides for phasing of major improvements to encourage infill and redevelopment of urban lands prior to facilities and improvements which would cause premature development of urbanizable lands or conversion of rural lands to urban uses. The *2035 TSP* does not promote extension of streets outside the UGB that would promote urbanization of rural lands.
OAR 660-012-0060 Plan and Land Use Regulation Amendments	
(1) If an amendment to a functional plan, an acknowledged comprehensive plan, or a land use regulation (including a zoning map) would significantly affect an existing or planned transportation facility, then the local government must put in place measures as provided in section (2) of this rule, unless the amendment is allowed under section (3), (9) or (10) of this rule. A plan or land use regulation amendment significantly affects a transportation facility if it would: (a) Change the functional classification of an existing or planned transportation facility (exclusive of correction of map errors in an adopted plan); (b) Change standards implementing a functional classification system; or (c) Result in any of the effects listed in paragraphs (A) through (C) of this subsection based on projected conditions measured at the end of the planning period identified in the adopted TSP. As part of evaluating projected conditions, the amount of traffic projected to be generated within the area of the amendment may be reduced if the amendment	As part of the *2035 TSP* adoption package, section 67 of Ordinance No. 20528 will be deleted, thereby lifting the trip cap imposed on the properties rezoned by that ordinance. Ordinance No. 20528 was adopted in May, 2014, as an Envision Eugene efficiency measure. Ordinance No. 20528 created a new E-2 Mixed Used Employment zone in West Eugene and converted I-1 Campus Industrial zone to the E-1 Campus Employment zone in three areas of the City. Section 67 of Ordinance No. 20528 imposed a trip cap on all of the properties that are subject to a code amendment or zone change that would allow uses that would generate more traffic than is currently allowed on those properties. Specifically, the City imposed trip caps on all of the properties where the currently allowed uses will be expanded, either as a result of the newly-named E-1 zone or a zone change to C-2 or E-2. With the proposed trip caps, traffic generated from the subject properties after the code amendments and zone changes could not have exceed the amount of traffic that could be generated from these properties prior to adoption of the code amendments and zone changes. The trip cap was imposed on a corridor-level, and the

includes an enforceable, ongoing requirement that would demonstrably limit traffic generation, including, but not limited to, transportation demand management. This reduction may diminish or completely eliminate the significant effect of the amendment. (A) Types or levels of travel or access that are inconsistent with the functional classification of an existing or planned transportation facility; (B) Degrade the performance of an existing or planned transportation facility such that it would not meet the performance standards identified in the TSP or comprehensive plan; or (C) Degrade the performance of an existing or planned transportation facility that is otherwise projected to not meet the performance standards identified in the TSP or comprehensive plan.	trip cap numbers were aggregate for all the affected lots. The aggregate vehicular trip cap within the West Eugene study area is 4,960 trips. The aggregate vehicular trip cap for the three discrete E-1 Campus Employment zoned areas are as follows: Greenhill Technology Park – 1250, Willow Creek – 1270, and Chad Drive – 1370. As discussed above, in determining the City's transportation needs the *2035 TSP* modeling assumed that the City will continue to see growth in employment and population between now and the year 2035 in a manner consistent with the existing Comprehensive Plan land use designations, within the existing Urban Growth Boundary (UGB) and consistent with the growth forecast adopted into the *Metro Plan.* Regarding the population and employment distributions, Staff from the cities of Eugene and Springfield, Lane County and Lane Council of Governments (LCOG) worked collaboratively to identify where the estimated year 2035 population and employment growth might occur within the region as well as within individual areas of each city. Based on these estimates of future job and household growth and distribution, LCOG developed traffic volume forecasts for the city's collector and arterial street system, using an emme travel demand model. To reflect the efficiency measures adopted by Ordinance No. 20528, the growth and distribution forecasts that served as the basis for the travel demand model included a higher distribution of the employment growth to the newly created E-2 Mixed Used Employment zone in West Eugene and the three areas of the City where I-1 Campus Industrial zone was converted to the E-1 Campus Employment zone. Based on the modeling, to address the increased travel demand resulting, in part, by the higher distribution of employment growth in the newly created E-2 Mixed Used Employment zone in West Eugene and the three areas of the City where I-1 Campus Industrial zone was converted to the E-1 Campus Employment zone, the *2035 TSP* includes the following: 1. Citywide LOS E 2. 1.0 v/c for specified ODOT facilities, including West 11th Avenue from Ed Cone east into

	downtown, Coburg Road in the vicinity of the Beltline Highway interchange as well as from Harlow Road to downtown, Randy Papé Beltline/W 11th Avenue. 3. MM-3, Construct local arterial bridge over the Willamette River to the north of the Beltline Highway, connecting Division Avenue to Green Acres Road; construct operational improvements to existing Randy Papé Beltline Highway/Delta Highway ramps consistent with the Beltline Highway Facility Plan. 4. MM-4, Improve I-5/Randy Papé Beltline Highway interchange (project is currently funded and underway). 5. MM-6, Improve frequent transit service and multimodal travel along Coburg Road and transit connections to Springfield. 6. MM-9, West Eugene EmX extension along W 6th, 7th, and 11th Avenues, Garfield and Charnelton Streets (project is currently funded and under construction) 7. MM-14, Upgrade W 11th Avenue consistent with major arterial standards, including provision of four travel lanes, center median, bike lanes, sidewalks on both sides of the road, and planting strips 8. MM-20, Add lanes on the Randy Papé Beltline Highway and provide intersection improvements at the Randy Papé Beltline Highway/W 11th Avenue and Randy Papé Beltline Highway/Roosevelt Boulevard intersections. Because the *2035 TSP*'s modeling, needs analysis and proposed transportation system recognizes and addresses the increased travel demand anticipated by the newly created E-2 Mixed Used Employment zone in West Eugene and the three areas of the City where I-1 Campus Industrial zone was converted to the E-1 Campus Employment zone, the trip caps imposed by Ordinance No. 20528 can be lifted.

(9) Notwithstanding section (1) of this rule, a local government may find that an amendment to a zoning map does not significantly affect an existing or planned transportation facility if all of the following requirements are met. (a) The proposed zoning is consistent with the existing comprehensive plan map designation and the amendment does not change the comprehensive plan map; (b) The local government has an acknowledged TSP and the proposed zoning is consistent with the TSP; and (c) The area subject to the zoning map amendment was not exempted from this rule at the time of an urban growth boundary amendment as permitted in OAR 660-024-0020(1)(d), or the area was exempted from this rule but the local government has a subsequently acknowledged TSP amendment that accounted for urbanization of the area.	The needs assessment and resulting projects (set forth in Chapter 4) that establish a transportation system adequate to meet the identified local transportation needs are based upon the land use designations established by the *Metro Plan.* Because the *2035 TSP* is based on the *Metro Plan* land use designations, any zone allowed within the land use designation is consistent with both the *Metro Plan* and this *2035 TSP*. Looking ahead, when the City adopts a new comprehensive plan, unless the new comprehensive plan changes the current *Metro Plan* land use designations, a zone allowed within the land use designation will be consistent with both the new comprehensive plan and this *2035 TSP.* If adoption of the new comprehensive plan includes an expansion of the UGB, any amendments to the *2035 TSP* that are necessary to address the expansion area will be adopted currently with the UGB amendment.

<u>*Goal 13 - Energy Conservation*</u>. *To conserve energy.*

The amendments do not impact energy conservation. Therefore, Statewide Planning Goal 13 does not apply.

<u>*Goal 14 - Urbanization*</u>. *To provide for an orderly and efficient transition from rural to urban land use.*

The City is currently in compliance with Goal 14. The amendments will not change the *TransPlan* and *Metro Plan* provisions adopted to preserve the distinction between urban and rural uses through the development of policies and programs that provide for more efficient urban uses within the UGB, thus preserving rural lands for rural uses.

While the City is in the midst of creating a comprehensive land use plan for 2035 that may include future UGB expansion areas, these amendments are for the *existing Eugene UGB* and do not address any future UGB expansion areas that may occur. If expansion areas are eventually approved, the *2035 TSP* will need to be updated to include those areas. The amendment updates the transportation section of the *Metro Plan* through incorporating the *2035 TSP*. The *2035 TSP* ensures compliance with Oregon Administrative Rule 660-012, which governs transportation system development in the state and requires conformance with the Regional Transportation Plan. The adoption of these amendments does not alter the City's compliance with Goal 14. The amendment is consistent with this goal.

Goal 15 - Willamette River Greenway. To protect, conserve, enhance and maintain the natural, scenic, historical, agricultural, economic and recreational qualities of lands along the Willamette River as the Willamette River Greenway.

The Willamette River Greenway area with the Urban Growth Boundary is governed by existing local provisions that have been acknowledged as complying with Goal 15. Those provisions will be unchanged by the amendments. The amendments will not change *TransPlan's* and the *Metro Plan*'s provisions related to the protection and maintenance of the scenic, historical, economic and recreational qualities of lands along the Willamette River. Further, the amendments will not affect *TransPlan*'s and the *Metro Plan*'s compliance with Goal 15.

Nearly all of projects in the Eugene 2035 Transportation System Plan are located outside of the Willamette River Greenway area. Individual transportation projects that are located in the Willamette River Greenway are required to conduct an individual analysis of Goal 15 compliance during the project development phase of work. This proposed amendment is consistent with this goal.

Goal 16 through 19 - Estuarine Resources, Coastal Shorelands, Beaches and Dunes, and Ocean Resources.

There are no coastal, ocean, estuarine, or beach and dune resources related to the property effected by these amendments. Therefore, these goals are not relevant and the amendments will not affect compliance with Statewide Planning Goals 16 through 19.

(2) The proposed amendment does not make the Metro Plan internally inconsistent.

Until now, *TransPlan*, adopted as a functional plan to the *Metro Plan*, served as the City's regional transportation system plan (RTSP), local transportation system plan, and pedestrian and bicycle master plan. While *TransPlan* will continue to serve as the City's RTSP, the *2035 TSP* will serve as the City's local transportation system and as the City's pedestrian and bicycle master plan. Because *TransPlan* will continue to serve as the RTSP for Eugene, Springfield, and Metropolitan Lane County until a new RTSP is adopted, *TransPlan* remains a functional plan of the *Metro Plan*. The *2035 TSP*, also adopted as part of the *Metro Plan*, must be consistent with *TransPlan*. In addition to the findings set forth in Table A (OAR 660-012-0015) and the findings set forth regarding the consistency between the *2035 TSP* and the Transportation Element of the *Metro Plan* (which are incorporated herein by reference), the findings set forth below demonstrate that the *2035 TSP* (and corresponding *Metro Plan* and *TransPlan* amendments) are consistent with both *TransPlan* and the *Metro Plan* and will not make the documents internally inconsistent.

TransPlan

The *2035 TSP* is consistent with *TransPlan*'s goals and policies. The following table (Findings Table B) provides a comparison and consistency evaluation between the goals and policies contained in *TransPlan* and the *2035 TSP*.

***TransPlan* and *2035 TSP* Consistency**	
***TransPlan* Goals**	**Complimentary *2035 TSP* Goals**
Provide an integrated transportation and land use system that supports choices in modes of travel and development patterns that will reduce reliance on the auto and enhance livability, economic opportunity, and the quality of life.	Create an integrated transportation system that is safe and efficient; supports the *Metro Plan*'s land use diagram and *Envision Eugene, A Community Vision for 2032* (2012), the City of Eugene's target for a 50 percent reduction in fossil fuel consumption, and other City land use and economic development goals; reduces reliance on single-occupancy automobiles; and enhances community livability.
Enhance the Eugene-Springfield metropolitan area's quality of life and economic opportunity by providing a transportation system that is: a) Balanced, b) Accessible, c) Efficient, d) Safe, e) Interconnected, f) Environmentally responsible, g) Supportive of responsible and sustainable development, h) Responsive to community needs and neighborhood impacts, and i) Economically viable and financially stable.	Advance regional sustainability by providing a transportation system that improves economic vitality, environmental health, social equity, and overall well-being. Strengthen community resilience to changes in climate, increases in fossil fuel prices, and economic fluctuations by making the transportation networks diverse, adaptable, and not reliant on any single mode. Address the transportation needs and safety of all travelers, including people of all ages, abilities, races, ethnicities, and incomes. Through transportation investments, respond to the needs of system users, be context sensitive, and distribute the benefits and impacts of transportation decisions fairly throughout the city. By the year 2035 triple the percentage of trips made on foot, by bicycle, and by transit from 2014 levels. [Note: Eugene used the Triple Bottom Line standard for sustainable planning.]
***TransPlan* Policy Topic Areas**	**Complimentary *Eugene TSP* Policy, action summary**
Land Use / Nodal Development	Key Corridor Planning, Services
Transit-Supportive land use patterns	Key Corridor Planning, Services
Multi-modal improvements	Multi-modal improvements, Complete Streets policy
Transportation Demand Management	Transportation Demand Management/TSMO

Congestion Management	TDM, ITS, and new LOS standards
Parking Management	Parking Management, code review
Transportation Infrastructure Protection	Transportation Infrastructure Protection, maintenance
Intermodal connectivity	Intermodal connectivity
Corridor preservation	Rights-of-way preservation, reuse
Neighborhood livability	Walkable neighborhoods, inviting environment, neighborhood context, neighborhood safety, equity between neighborhoods, community engagement, community health
Mobility, LOS	Mobility, travel time reliability, updated LOS
Safety	Safety, Vision Zero's "no loss of life is acceptable"
Emergency Response	Emergency response as important component of a Complete Street
Coordinated roadway network	Complete Streets, connectivity, connections between modes
Access management, Efficiency	Improved circulation, ITS Note: Since *TransPlan* Eugene has adopted and enforces an updated access management program
Improved transit, BRT, HOV priority, park & ride	Improved transit (goal of doubling ridership), BRT, frequent transit networks and Key Corridors. Park and ride facility is in project list. Note: Since *TransPlan* Eugene has adopted an updated code to address park and ride facilities.
Support for bike systems on roadways, especially arterial and collector roadways	Support for complete bike network, improved signage, protections from vehicles, bike share program, bike parking. Note: *2035 TSP* incorporates key components of the 2012 Pedestrian and Bicycle Master Plan
Bikeway connections to new development	Bikeway connections to new development
Pedestrian environment that is safe, comfortable, continuous and direct	"Ensure that there are safe, accessible, comfortable, and direct sidewalk connections between residential areas, major destinations, and transit stops. Continually improve walking comfort, safety, and accessibility through design, operations, retrofits, and maintenance. Provide landscaped setback sidewalks of ample width and safe street crossings to encourage people to walk." Note: *2035 TSP* incorporates key components of the 2012 Pedestrian and Bicycle Master Plan
reasonable and reliable travel times for freight	Travel time reliability, recognition of designated freight routes. "Encourage public and private

	partnerships with the freight transport industry."
Supports Cascadia High Speed Rail Corridor	Supports Cascadia High Speed Rail Corridor
Supports Eugene airport, Airport Master Plan	Supports Eugene airport, Airport Master Plan
Supports rail – bus connections	Supports all intermodal connections
Support adequate funding	Supports funding transportation improvements, encourages continued public involvement and support for transportation improvements. Project list is fundable given current funding projections.
Operate and maintain transportation facilities in a way that reduces the need for more expensive future repair.	Operate and maintain transportation facilities in a way that reduces the need for more expensive future repair.
Set priorities for investment of Oregon and federal revenues	Priorities are set by policies.
Maintain transportation performance and improve safety by improving system efficiency and management before adding capacity to the transportation system	Maintain transportation performance and improve safety by improving system efficiency and management before adding capacity for automobiles to the transportation system by using the following priorities for developing the Eugene Capital Improvement Program (CIP) and Eugene projects in the Metropolitan Transportation Improvement Program (MTIP): Protect the existing system. The highest priority is to preserve or improve the functionality of the existing transportation system by means such as access management, transportation demand management, improved traffic operations, technologies, accommodating "active transportation" options not previously present, and keeping roads well maintained to avoid reconstruction. Improve the efficiency and safety of existing facilities. The second priority is to make minor improvements to existing streets, such as adding turning lanes at intersections, providing and enhancing pedestrian, bicycle and transit facilities, and extending or connecting streets pursuant to existing plans. Add capacity to the existing system. The third priority is to make major improvements to existing transportation facilities such as adding general purpose lanes and making alignment corrections to accommodate legal-sized vehicles. Add new facilities to the system. The lowest priority is to add new transportation facilities for motorized vehicles, such as new roadways. New streets that are needed and planned for connectivity are a higher priority, as noted in (b), above.

	Implement higher priority measures first unless a lower priority measure is demonstrated to be more cost-effective or better supports safety, growth management, or other livability and economic considerations. Provide justification for using lower priority measures before higher priority measures.

The manner in which the *2035 TSP* supports and advances the alternative performance standards approved by LCDC in 2001 and adopted as part of *TransPlan* are set forth above in the Goal 12 findings (Findings Table A). Those detailed findings are incorporated herein by reference.

Metro Plan

Chapter III of the *Metro Plan* contains eleven specific elements that address a comprehensive list of topics, including (A) Residential Land Use and Housing Element (B) Economic Element (C) Environmental Resources Element (D) Willamette River Greenway, River Corridors, and Waterways Element (E) Environmental Design Element (F) Transportation Element (G) Public Facilities and Services Element, and (H) Parks and Recreation Facilities Element. Findings for relevant policies from each element are contained in this report. Applicable *Metro Plan* policies are italicized.

The following policies from the *Metro Plan* (identified below in *italics*) are applicable to these amendments. Based on the findings provided below, the amendments are consistent with and supported by the applicable provisions of the *Metro Plan*.

A. *Metro Plan* Residential Land Use and Housing Element

The *2035 TSP* is based on the *Metro Plan*'s land use plan and is consistent with the population projections inherent in that plan. The *2035 TSP* does not change the *Metro Plan*'s land use or housing element, or change the desired mix, location, density, or tenure of the region's housing plan. This Residential Land Use and Housing Element and Residential Land and Housing Needs Analysis contains the following relevant housing policies related to the *2035 TSP*.

A.7 Endeavor to provide key urban services and facilities required to maintain a five-year supply of serviced, buildable residential land.

A.8 Require development to pay the cost, as determined by the local jurisdiction, of extending public services and infrastructure. The cities shall examine ways to provide subsidies or incentives for providing infrastructure that support affordable housing and/or higher density housing.

A.10 Promote higher residential density inside the UGB that utilizes existing infrastructure, improves the efficiency of public services and facilities, and conserves rural resource lands outside the UGB.

The *2035 TSP* contains multiple goals and polices that support the above stated housing policies and land use efficiency measures. These TSP goals and policies include, but are not limited to:

- Goal 1: Create an integrated transportation system that is safe and efficient; supports the *Metro Plan*'s land use diagram and Envision Eugene, A Community Vision for 2032 (2012), the City of Eugene's target for a 50 percent reduction in fossil

fuel consumption, and other City land use and economic development goals; reduces reliance on single-occupancy automobiles; and enhances community livability.

- Policy: Prioritize improved transit service in Key Corridors and other areas with sufficient employment, activities, or residential density that best support transit service and transit services that connect residents to employment centers. If operational funding is sufficient, extend transit to support higher density housing and employment development planned for other areas.

- Policy: Foster neighborhoods where Eugene residents could meet most of their basic daily needs without an automobile by providing streets, sidewalks, bikeways, and access to transit in an inviting environment where all travelers feel safe and secure.

The above stated TSP goal and policies are examples of consistency between the Eugene *2035 TSP* and relevant *Metro Plan* Residential Land Use and Housing policies. The proposed amendments will further support and enhance the *Metro Plan*'s Residential Land Use and Housing Element through strengthening multi-modal connections, enhancing bike, pedestrian and transit facilities and target multi-modal infrastructure in higher density, mixed use areas throughout Eugene. The proposed amendments are consistent with this *Metro Plan* Element.

B. *Metro Plan* Economic Element

The Economic Element of the *Metro Plan* addresses the economic needs of current and future residents of the metropolitan area. The overarching economic goal of the *Metro Plan* Element is to, "Broaden, improve, and diversify the metropolitan economy while maintaining or enhancing the environment."

The Economic Element of the *Metro Plan* contains the following relevant economic policies related to the Eugene *2035 TSP*:

B.11 Encourage economic activities, which strengthen the metropolitan area's position as a regional distribution, trade, health, and service center.

B.14 Continue efforts to keep the Eugene and Springfield central business districts as vital centers of the metropolitan area.

B.17 Improve land availability for industries dependent on rail access.

B.18 Encourage the development of transportation facilities which would improve access to industrial and commercial areas and improve freight movement capabilities by implementing the policies and projects in the Eugene-Springfield Metropolitan Area Transportation Plan (TransPlan) and the Eugene Airport Master Plan.

B.19 Local jurisdictions will encourage the allocation of funds to improve transportation access to key industrial sites or areas through capital budgets and priorities.

B.28 Recognize the vital role of neighborhood commercial facilities in providing services and goods to a particular neighborhood.

The *2035 TSP* does not modify the industrial designation of any lands. The *2035 TSP* contains the goals and polices that support the *Metro Plan*'s economic policies:

- Goal 2: Advance regional sustainability by providing a transportation system that improves economic vitality, environmental health, social equity, and overall well-being.
- Policy: Prioritize improved transit service in Key Corridors and other areas with sufficient employment, activities, or residential density that best support transit service and transit services that connect residents to employment centers. If operational funding is sufficient, extend transit to support higher density housing and employment development planned for other areas.
- Improve travel time reliability between key origins and destinations for transit, regional freight movement, and other trips for which on-time arrivals are important.
- Facilitate efficient access for goods, employees, and customers to and from employment, commercial, and industrial lands, including freight access to designated freight routes, highways, rail yard, and the Eugene Airport. Increase multimodal access for employees to employment centers.
- Support ODOT's efforts to improve Randy Papé Beltline Highway for transportation system efficiency, improved safety, and improved connections for people travelling by foot, bike, and bus. The *Beltline Highway: Coburg Road to River Road Facility Plan* is incorporated into this TSP, contained in Volume 2. The City of Eugene supports completion of the NEPA review, and implementation of the resultant recommended improvements.
- Encourage walking as the most attractive mode of transportation for short trips (e.g., within .5 miles) within and to activity centers, downtown, key corridors, and major destinations, and as a means of accessing transit.
- Promote the efficiency with which freight and deliveries are transported without worsening impacts to the environment, social and neighborhood context, promotion of "Complete Streets," or safety.
- Encourage public and private partnerships with the freight transport industry to develop mutually beneficial strategies and initiatives
- Encourage the use of rail for movement of freight and long distance passenger trips. Support the Eugene Airport as a regional transportation facility.
- Use transportation investments to support industries and employment sectors targeted by City and regional adopted economic development strategies.

The above stated *2035 TSP* goals and policies are examples of consistency between the *2035 TSP* and relevant *Metro Plan* economic policies. The TSP will provide a greater range of transportation options for businesses and employees. The proposed amendments are consistent with this *Metro Plan* Element.

C. Environmental Resources Element

The Environmental Resources Element addresses the natural assets and hazards in the metropolitan area. The policies of this element emphasize reducing urban impacts on wetlands throughout the metropolitan area and planning for the natural assets and constraints on undeveloped lands on the urban fringe.

The Environmental Resources Element of the *Metro Plan* contains the following relevant goal and policies related to the Eugene *2035 TSP* (policies related to forest lands, agricultural lands, and mineral and aggregate resources were omitted because there are no subject lands within the Eugene UGB):

Goal: Provide a healthy and attractive environment, including clean air and water, for the metropolitan population.

C.22 Design of new street, highway, and transit facilities shall consider noise mitigation measures where appropriate.

C.23 Design and construction of new noise-sensitive development in the vicinity of existing and future streets and highways with potential to exceed general highway noise levels shall include consideration of mitigating measures, such as acoustical building modifications, noise barriers, and acoustical site planning. The application of these mitigating measures must be balanced with other design considerations and housing costs.

C.24 Local governments shall continue to monitor, to plan for, and to enforce applicable noise standards and shall cooperate in meeting applicable federal and state noise standards.

The City of Eugene has previously adopted Goal 5 habitat resource protections, stormwater protection measures, and open space plans, none of which will change as a result of this TSP amendment. The *2035 TSP* contains goals and polices which support these environmental policies, including, but not limited to the following:

- Goal 2: Advance regional sustainability by providing a transportation system that improves economic vitality, environmental health, social equity, and overall well-being.
- Goal 3: Strengthen community resilience to changes in climate, increases in fossil fuel prices, and economic fluctuations by making the transportation networks diverse, adaptable, and not reliant on any single mode.
- Create a railroad quiet zone throughout the City. Prioritize implementation of a quiet zone in the downtown and Whiteaker areas.
- Avoid, protect, and enhance habitat in transportation projects where possible. Minimize and

mitigate impacts when needed.

- Support the use of more highly fuel efficient vehicles including electric, hydrogen fuel cell, and non-motorized vehicles.

- Create a strategy that advances the goal of having an integrated transportation system that reduces fossil fuel consumption by 50 percent and reduces reliance on single-occupancy automobiles.

- Prioritize capital projects and programs that will facilitate the achievement of the *2035 TSP's* pedestrian, bicycle and transit policies.

- Continue work to identify possible transportation infrastructure improvements that will make walking, bicycling and the use of transit safe and highly convenient.

- Protect, and enhance habitat in transportation projects where possible. Minimize and mitigate impacts of transportation projects when needed.

- Provide leadership in regional and State coordination efforts that support Eugene's environmental policies.

The above stated TSP goals and policies are examples of consistency between the Eugene *2035 TSP* and relevant *Metro Plan* environmental policies. The proposed amendments will support and enhance the *Metro Plan*'s Environmental Resources Element through strengthening environmentally sound transportation options and an overall more sustainable transportation system. The *2035 TSP* strives to reduce vehicle-related greenhouse gas emissions and look at alternative energy infrastructure. The proposed amendments are consistent with this *Metro Plan* Element.

D. Willamette River Greenway, River Corridors, and Waterways Element

The Willamette River Greenway, River Corridors, and Waterways Element address these specific natural assets in the metropolitan area. The policies of this element emphasize reducing urban impacts on these resources throughout the metropolitan area.

The Willamette River Greenway, River Corridors, and Waterways Element of the *Metro Plan* contain the following relevant policies related to the Eugene *2035 TSP*:

D.2 Land use regulations and acquisition programs along river corridors and waterways shall take into account all the concerns and needs of the community, including recreation, resource, and wildlife protection; enhancement of river corridor and waterway environments; potential for supporting non-automobile transportation; opportunities for residential development; and other compatible uses.

D.9 Local and state governments shall continue to provide adequate public access to the Willamette River Greenway.

D.11 The taking of an exception shall be required if a non-water-dependent transportation facility requires placing of fill within the Willamette River Greenway setback.

As described in the text of the *2035 TSP*, the Willamette River is a major influence on the city's transportation system but riverine travel is not a functioning mode of transportation in modern times. Eugene enjoys a substantial pedestrian-bicycle shared-use path system parallel to the Willamette River. Although the pathway system is extensive, existing needs are related to the width of pathways (the busier sections are too narrow to comfortably accommodate all of the users), lack of connections to some adjacent neighborhoods, and the lack of consistent and regular pathway lighting.

An estimation of future traffic conditions found that all four Willamette River motor vehicle bridge crossings could experience vehicular congestion and long queues at traffic signals.

The *2035 TSP* contains goals and polices which support these Willamette River Greenway, River Corridors, and Waterways policies. These include, but are not limited to:

- Goal: Advance regional sustainability by providing a transportation system that improves economic vitality, environmental health, social equity, and overall well-being.

- Support ODOT's efforts to improve Randy Papé Beltline Highway for transportation system efficiency, improved safety, and improved connections for people travelling by foot, bike, and bus. The *Beltline Highway: Coburg Road to River Road Facility Plan* is incorporated into this TSP, contained in Volume 2. The City of Eugene supports completion of the NEPA review, and implementation of the resultant recommended improvements.

In addition to the Randy Papé Beltline Highway study referenced in the policy above, the *2035 TSP* proposes several potential improvements to the shared use paths within the Willamette Greenway and several studies for potential street or crossing improvements.

The Eugene Code contains provisions for protecting the Willamette Greenway in a manner consistent with the *Metro Plan* (EC 9.8800-9.8825). Should any of the potential projects be moved to the design stage, they must meet the conditions of the Eugene Code before they could proceed further.

The above stated *2035 TSP* goal and policies and Eugene Code protections are examples of consistency between the Eugene *2035 TSP* and relevant *Metro Plan* Willamette River Greenway, River Corridors, and Waterways policies. The proposed amendment will support and enhance the *Metro Plan*'s Willamette River Greenway, River Corridors, and Waterways Element through by providing improved access to waterways. The proposed amendments are consistent with this *Metro Plan* Element.

E. Environmental Design Element

The Environmental Design Element is concerned with that broad process which molds the various components of the urban area into a distinctive, livable form that promotes a high quality of life. This Element is concerned with how people perceive and interact with their surroundings.

The Environmental Design Element of the *Metro Plan* contains the following relevant policies related to the Eugene *2035 TSP*: E.3 and E.4.

E.3 The planting of street trees shall be strongly encouraged, especially for all new developments and redeveloping areas (where feasible) and new streets and reconstruction of major arterials within the UGB.

E.4 Public and private facilities shall be designed and located in a manner that preserves and enhances desirable features of local and neighborhood areas and promotes their sense of identity.

The Eugene *2035 TSP* contains goals and polices which support these Environmental Design policies. These include, but are not limited to:

- Goal 4: Address the transportation needs and safety of all travelers, including people of all ages, abilities, races, ethnicities, and incomes. Through transportation investments, respond to the needs of system users, be context sensitive, and distribute the benefits and impacts of transportation decisions fairly throughout the city.
- Enhance the tree canopy along streets.
- Provide stormwater facilities within street construction projects by incorporating low impact development and green infrastructure practices.
- Design, construct, maintain, and operate all streets to provide comprehensive and integrated transportation networks that serve people of all ages and abilities, promote commerce, and support the comprehensive land use plan's vision for growth and development in a responsible and efficient manner. A "complete street" allows safe travel for automobiles and emergency responders, bicycles, walking, transit, and freight. In addition to fulfilling a street's basic transportation functions and providing access to properties, streets and sidewalks should be designed to be attractive, safe, accessible, sustainable, and healthy components of the City's environment.

The above stated *2035 TSP* goals and policies are examples of consistency between the *2035 TSP* and relevant Environmental Design policies. The proposed amendments will further support and enhance the *Metro Plan*'s Environmental Design Element by providing greater flexibility in future street design. The *2035 TSP* will also enhance the bicycle and pedestrian environment for new and redeveloped properties, creating a more liveable community. The proposed amendments are consistent with this *Metro Plan* Element.

F. Transportation Element

The *Metro Plan* Transportation Element addresses surface and air transportation in the metropolitan area. The Eugene-Springfield Metropolitan Area Transportation Plan (*TransPlan*) provides the basis for surface transportation. The goals and policies in the *Metro Plan* Transportation Element are identical to those in *TransPlan*, as *TransPlan* serves as the functional plan for transportation issues in the Metro Area.

Policies in the *Metro Plan* Transportation Element are organized by the following four topics related to transportation: Land Use, Transportation Demand Management, Transportation System Improvements, and Finance.

While all of the *Metro Plan* Transportation Element goals and policies are relevant to the *2035 TSP*, specific *Metro Plan* policies are highlighted in this Finding to illustrate consistency between *Metro Plan* policies and those of the Eugene *2035 TSP*.

- *Metro Plan Land Use Policy F.4: Require improvements that encourage transit, bicycles, and pedestrians in new commercial, public, mixed use, and multi-unit residential development.*

  2035 TSP Policies:

  - ["Complete Streets Policy"] Design, construct, maintain, and operate all streets to provide comprehensive and integrated transportation networks that serve people of all ages and abilities, promote commerce, and support the comprehensive land use plan's vision for growth and development in a responsible and efficient manner. A "complete street" allows safe travel for automobiles and emergency responders, bicycles, walking, transit, and freight. In addition to fulfilling a street's basic transportation functions and providing access to properties, streets and sidewalks should be designed to be attractive, safe, accessible, sustainable, and healthy components of the City's environment.
  - Facilitate efficient access for goods, employees, and customers to and from employment, commercial, and industrial lands, including freight access to designated freight routes, highways, rail yard, and the Eugene Airport. Increase multimodal access for employees to employment centers.
  - Encourage walking as the most attractive mode of transportation for short trips (e.g., within .5 miles) within and to activity centers, downtown, key corridors, and major destinations, and as a means of accessing transit.
  - Create conditions that make bicycling more attractive than driving for most trips of two miles or less.

  2035 TSP Potential Action Items:

  - Articulate a process for implementing the complete streets policy, including responsibilities for decision making, public review, opportunities for appeals of decisions, the means of documenting and justifying decisions, and the collection and reporting of data that allows monitoring the effects of street design changes over time.
  - Update the Eugene *Design Standards and Guidelines for Eugene Streets, Sidewalks, Bikeways and Accessways* to implement the "complete streets policy" . . . .

- *Metro Plan TDM Policy F.8: Implement TDM strategies to manage demand at congested locations.*

  2035 TSP Potential Action Items:

  - Periodically review and update the City Code and administrative rules in the

downtown area, neighborhoods near the University of Oregon, mixed-use centers, and in areas experiencing changing conditions, such as where a transit corridor study has been completed, transit routes changed, or major bicycle facilities completed. Examples of possible changes to the code and policies may include:

- Requiring or allowing fewer parking spaces where conditions would allow less driving.
- Disconnecting the price of a residential parking space from a unit's rent.
- Aligning metered parking prices with demand.
- Facilitating conversion of on-street automobile parking spaces to bicycle lanes, bike parking, or expanded pedestrian and ground-level business amenities.
- Aligning land use and design standards at major transit stops to support transit ridership.
- Requiring ongoing transportation demand management (TDM) for large attractions and employment centers at times and locations where such measures are necessary to reduce congestion or optimize limited parking.

- *Metro Plan, Transportation System Improvement: System Wide Policy F.11: Develop or promote intermodal linkages for connectivity and ease of transfer among all transportation modes.*

  2035 TSP Policy

  - Promote connections between modes of transportation to make each mode more efficient, such as by connecting bicycle routes and bus, train, and airport services to each other; and connections to transportation facilities extending outside the City's planning area.
  - Ensure that there are safe, accessible, comfortable, and direct sidewalk connections between residential areas, major destinations, and transit stops. Continually improve walking comfort, safety, and accessibility through design, operations, retrofits, and maintenance. Provide landscaped setback sidewalks of ample width and safe street crossings to encourage people to walk.
  - Coordinate improvements to complement and improve the systems proposed in the Eugene Trails Plan and connections to regional trails.
  - Develop a well-connected and comfortable bikeway network. Ensure that there are safe, comfortable, and direct bikeway connections between residential areas, major destinations, and transit stops and provide secure bicycle parking facilities at these destinations.

- Update Eugene's Traffic Impact Analysis review regulations for new development to include review of walking and biking improvements and connections to nearby networks.

- *Metro Plan, Roadway System F.14: Address the mobility and safety needs of motorists, transit users, bicyclists, pedestrians, and the needs of emergency vehicles when planning and constructing roadway system improvements.*

  2035 TSP Policies:

  - Consider safety first when making transportation decisions. Strive for zero transportation-related fatalities by reducing the number and severity of crashes through design, operations, maintenance, education, and enforcement. Prioritize safety improvements for people who walk, bike and use mobility devices because no loss of life or serious injury on our streets is acceptable.
  - Facilitate prompt emergency responses. Ensure that fire and emergency response routes remain passable by design.
  - Plan for, design and construct or reconstruct streets to achieve consistency between motorists' speeds and target speed limits.

  2035 TSP Potential Action Items

  - With Lane County Public Health Department, identify mutual objectives and opportunities to collaboratively promote bicycle and pedestrian activities, reduce injury crashes and fatalities, integrate health considerations into transportation decisions, and improve emergency medical systems.
  - Update city design standards, as necessary, to address emergency vehicle passage on officially recognized emergency response routes and consider accommodations for Fire Department Ladder Operations where tall buildings exist or are planned. Involve emergency responders in changes to street designs.

- *Metro Plan, Transportation System Improvement: Transit System F.18: Improve transit service and facilities to increase the system's accessibility, attractiveness, and convenience for all users, including the transportation disadvantaged population.*
  - Promote the use of public transit and the continued development of an integrated, reliable, regional public transportation system.
  - Prioritize improved transit service in Key Corridors and other areas with sufficient employment, activities, or residential density that best support transit service and transit services that connect residents to employment centers. If operational funding is sufficient, extend transit to support higher density housing and employment development planned for other areas.

- *Metro Plan, Transportation System Improvement: Bicycle System F.22: Construct and improve the region's bikeway system and provide bicycle system support facilities for both new development and redevelopment/expansion.*

  2035 TSP Policies:

- Create conditions that make bicycling more attractive than driving for most trips of two miles or less.
- Develop a well-connected and comfortable bikeway network. Ensure that there are safe, comfortable, and direct bikeway connections between residential areas, major destinations, and transit stops and provide secure bicycle parking facilities at these destinations.
- Continually improve the comfort and safety of bicycling through design, operations, retrofits, and maintenance. Identify and develop "low stress" bikeways to attract new cyclists.

- *Metro Plan, Transit System Improvement: Pedestrian System F.26: Provide for a pedestrian environment that is well integrated with adjacent land uses and is designed to enhance the safety, comfort, and convenience of walking.*

  2035 TSP Policy:
  - Ensure that there are safe, accessible, comfortable, and direct sidewalk connections between residential areas, major destinations, and transit stops. Continually improve walking comfort, safety, and accessibility through design, operations, retrofits, and maintenance. Provide landscaped setback sidewalks of ample width and safe street crossings to encourage people to walk.
  - Promote connections between modes of transportation to make each mode more efficient, such as by connecting bicycle routes and bus, train, and airport services to each other; and connections to transportation facilities extending outside the City's planning area.

  2035 TSP Potential Action Items:
  - Amend the Eugene Code (*e.g.*, EC 9.6505) and policies to consistently require sidewalk installation throughout newly divided and developed lands, such as by requiring sidewalk construction concurrent with street improvements or by bonding for completion of the sidewalks if development on individual lots does not fill in the system in a reasonable amount of time.
  - Maintain a sidewalk infill and improvement program that considers new funding sources, credits and loans, and expanded development requirements to complete missing sidewalk segments, to avoid creating gaps in sidewalk networks in new development areas and to upgrade existing sidewalks in high traffic areas to provide needed width, landscaping, removal of barriers, and to implement the City's Americans with Disability Act program.

- *Metro Plan Finance Policy F.34: Operate and maintain transportation facilities in a way that reduces the need for more expensive future repair.*

  2035 TSP Policy:
  - Establish, improve, and maintain transportation facilities in ways that cost-effectively provide desired levels of service, consider facilities' lifecycle costs, and maintain the City's long-term financial sustainability. Favor

transportation systems that move people and goods at lesser total life-cycle cost to the City and its residents.

- Improve system efficiency, safety, and management and re-purpose existing rights-of-way to include high-quality facilities for transit, walking, and bicycling before widening streets to expand capacity for motorized vehicles.

- *Metro Plan Policy F.15: Motor Vehicle Level of Service.*
  - The Levels of Service targets for Eugene will be amended in *TransPlan* and the *Metro Plan* concurrently with adoption of the *2035 TSP* to maintain policy consistency between the documents.

The above stated *Metro Plan* and *2035 TSP* policy sets are examples of the overall consistency between the Eugene *2035 TSP* and the *Metro Plan*'s Transportation Element policies. The proposed amendment will further support multi-modal transportation and its nexus to mixed use development as promoted by the *Metro Plan* and *TransPlan*. The proposed amendments are consistent with this *Metro Plan* Element.

G. Public Facilities and Services Element

This element incorporates the findings and policies in the *Eugene-Springfield Metropolitan Area Public Facilities and Services Plan* (Public Facilities and Services Plan), adopted as a refinement to the *Metro Plan*. The Public Facilities and Services Plan provide guidance for public facilities and services, including planned water, wastewater, stormwater, and electrical facilities. Transportation findings and policies are not part of the *Eugene-Springfield Metropolitan Area Public Facilities and Services Plan,* but rather are located in *TransPlan* and *2035 TSP*. The *2035 TSP* supports the public facilities policies of this element with this policy, as one example: "Reduce stormwater pollution and minimize runoff from streets and multi-use paths in a manner prescribed by Eugene's *Comprehensive Stormwater Management Plan*."

Other relevant *Metro Plan* policies are discussed in the previous Transportation Element section. The proposed amendments are consistent with this *Metro Plan* Element.

H. Parks and Recreation Facilities Element

This *Metro Plan* Element addresses Parks and Recreation Facilities in the Metro Area. There are no transportation-specific Parks and Recreation Facilities Element policies in the *Metro Plan* that directly relate to the 2035 Eugene Transportation System Plan. However, some TSP multiuse path projects overlap with recreational needs and were coordinated with City parks planners.

One example of consistency between this Eugene *2035 TSP* and the *Metro Plan* Parks and Recreation Facilities Elements are these policies that recognize and support recreational use of the transportation system:

- Improve community health by designing streets and paths to encourage increased physical activity by the public.

- Promote connections between modes of transportation to make each mode more efficient, such as by connecting bicycle routes and bus, train, and airport services to each other; and connections to transportation facilities extending outside the City's planning area.
- Coordinate improvements to complement and improve the systems proposed in the Eugene Trails Plan and connections to regional trails.

The amendments do not alter compliance with, and are consistent with, the Parks and Recreation Facilities Element of the *Metro Plan*.

I. Historic Preservation Element

This Element of the *Metro Plan* is written to preserve historic structures in the Metro area. There are no transportation specific Historic preservation Element policies in the *Metro Plan* that directly relate to the 2035 Eugene Transportation System Plan. However, individual projects in the TSP that use Federal funding must go through a National Environmental Policy Act (NEPA) process during project development. The NEPA process includes requirements for historic preservation that the City will adhere to.

The proposed amendments are consistent with this *Metro Plan* Element.

J. Energy Element

The Energy Element of the *Metro Plan* deals with the conservation and efficient use of energy in the metropolitan area and is meant to provide a long-range guide to energy-related decisions concerning physical development and land uses.

The Energy Element of the *Metro Plan* contains the following relevant policies related to the Eugene *2035 TSP*:

J.2 Carefully control, through the use of operating techniques and other methods, energy related actions, such as automobile use, in order to minimize adverse air quality impacts. Trade-offs between air quality and energy actions shall be made with the best possible understanding of how one process affects the other.

J.7 Encourage medium- and high-density residential uses when balanced with other planning policies in order to maximize the efficient utilization of all forms of energy. The greatest energy savings can be made in the areas of space heating and cooling and transportation. For example, the highest relative densities of residential development shall be concentrated to the greatest extent possible in areas that are or can be well served by mass transit, paratransit, and foot and bicycle paths.

J.8 Commercial, residential, and recreational land uses shall be integrated to the greatest extent possible, balanced with all planning policies to reduce travel distances, optimize reuse of waste heat, and optimize potential on-site energy generation.

The Eugene *2035 TSP* contains goals and polices that support these Energy Element policies. These include, but are not limited to:

- Goal 1: Create an integrated transportation system that is safe and efficient; supports the Metro Plan's land use diagram and Envision Eugene, A Community Vision for 2032 (2012), the City of Eugene's target for a 50 percent reduction in fossil fuel consumption, and other City land use and economic development goals; reduces reliance on single-occupancy automobiles; and enhances community livability.
- Goal 3: Strengthen community resilience to changes in climate, increases in fossil fuel prices, and economic fluctuations by making the transportation networks diverse, adaptable, and not reliant on any single mode.
- Policy: Support the use of more highly fuel efficient and electric, hydrogen cell, and non-motorized vehicles.

The proposed amendment will further support and enhance the *Metro Plan*'s Energy Element by considering environmental impacts and energy usage when planning and implementing Eugene's transportation system. The *2035 TSP* also supports higher densities for new and redeveloped properties, creating a more livable community and supporting frequent transit service. The proposed amendment are consistent with this *Metro Plan* Element.

K. Citizen Involvement Element

The Citizen Involvement Element of the *Metro Plan* recognizes that active, on-going, and meaningful citizen involvement is an essential ingredient to the development and implementation of any successful planning program. A Public Involvement Program for the update of the 2035 Eugene Transportation System Plan was developed in preparation of the project. This program was reviewed and endorsed by the Committee for Citizen Involvement (i.e. the Eugene Planning Commission). The program outlined the information, outreach methods, and involvement opportunities available to the citizens during the process. Details of the process are included in the Statewide Planning Goal 1 finding of this report. The proposed amendment is consistent with the *Metro Plan* Element.

Conclusion**:**
Based on the above findings, the proposed *Metro Plan* amendments, *TransPlan* amendments and *2035 TSP* adoption are all consistent with EC 9.7730 and Lane Code 12.225.

II. **Repeal of the Central Area Transportation Study** (CATS)

Ordinance No. 20322 (May 24, 2004), adopted the policies in the 2003 Central Area Transportation Study (CATS) as a refinement to the Eugene-Springfield Metropolitan Area General Plan. The adoption of the CATS update in 2004 was part of an ongoing process to improve Eugene's transportation system. CATS was intended to further refine *TransPlan* for a specific geographic boundary within Eugene. The *2035 TSP* updates and replaces the policies and proposed implementation strategies set forth in CATS. With an up-to-date Eugene-specific transportation system plan, CATS is no longer needed and should be repealed. Eugene's approval criteria for Refinement Plan amendments is set forth in Eugene Code 9.8424:

9.8424 **Refinement Plan Amendment Approval Criteria.** The planning commission shall evaluate proposed refinement plan amendments based on the criteria set forth below, and forward a recommendation to the city council. The city council shall decide whether to act on the

application. If the city council decides to act, it shall approve, approve with modifications or deny a proposed refinement plan amendment. Approval, or approval with modifications shall be based on compliance with the following criteria:

(1) The refinement plan amendment is consistent with all of the following:
- (a) Statewide planning goals.
- (b) Applicable provisions of the *Metro Plan*.
- (c) Remaining portions of the refinement plan.

(2) The refinement plan amendment addresses one or more of the following:
- (a) An error in the publication of the refinement plan.
- (b) New inventory material which relates to a statewide planning goal.
- (c) New or amended community policies.
- (d) New or amended provisions in a federal law or regulation, state statute, state regulation, statewide planning goal, or state agency land use plan.
- (e) A change of circumstances in a substantial manner that was not anticipated at the time the refinement plan was adopted.

As demonstrated by the findings set forth above, the adoption of the *2035 TSP*, which renders CATS unnecessary, is consistent with the statewide planning goals, applicable provisions of the *Metro Plan* and *TransPlan*. Those findings are incorporated herein by reference as the basis for repealing CATS. The repeal of CATS is intended to recognize the new community policies set forth in the *2035 TSP*. In 2004, when the City adopted CATS, the City did not have a Eugene-specific local transportation plan; the adoption of the *2035 TSP* renders CATS unnecessary.

III. Amendments to Eugene Code Chapter 9

Conforming amendments to Eugene Code Chapter 9 are needed to reflect the adoption of the *2035 TSP* as the City's local transportation system plan and to update the *TransPlan* policies set forth in Chapter 9 that are being concurrently amended through the proposed ordinance.

Eugene's approval criteria for code amendment is set forth in EC 9.8065.

9.8065 Code Amendment Approval Criteria. If the city council elects to act, it may, by ordinance, adopt an amendment to this land use code that:

(1) Is consistent with applicable statewide planning goals as adopted by the Land Conservation and Development Commission.

(2) Is consistent with applicable provisions of the *Metro Plan* and applicable adopted refinement plans.

(3) In the case of establishment of a special area zone, is consistent with EC 9.3020 Criteria for Establishment of an S Special Area Zone.

As demonstrated by the findings set forth above, the amendments to the *Metro Plan* and *TransPlan* and the adoption of the *2035 TSP* are consistent with the statewide planning goals and are consistent with applicable provisions of the *Metro Plan* and *TransPlan*. Those findings are incorporated herein by reference as the basis for adopting the conforming amendments to Chapter 9.

Table of Tables

Acronyms, Abbreviations and Select Definitions

Transportation planning relies on many acronyms, abbreviations and technical terms. A few of these are included below for reference.

2035 TSP	*Eugene 2035 Transportation System Plan*
ACSP	Arterial and Collector Street Plan
ADA	American with Disabilities Act
ADA Transition Plan	The Americans with Disabilities Act Transition Plan for Accessibility in Public Rights-of Way is the City of Eugene's plan to address accessibility specifically within the City's public rights-of-way for persons with disabilities. It was adopted in 2015.
ADT	Average Daily Traffic
APD/APS	Accessible Pedestrian Device/Accessible Pedestrian Signals: pedestrian activated device that communicates information about Walk and Don't Walk phase through non-visual formats (i.e. audible tones).
APM	Analysis and Procedures Manual: ODOT's methods and instructions for how to forecast future transportation conditions.
ARTS	All Roads Transportation Safety Program: program that provides funding for infrastructure and non-infrastructure projects that improve safety on all public roads.
BRT	Bus Rapid Transit (known as EmX in Eugene)
CIP	City of Eugene's Capital Improvement Program
Complete Streets	Streets designed and operated to enable safe access for all users regardless of age, ability or mode of travel.
CTR	Commute Trip Reduction
DLCD	Oregon Department of Land Conservation and Development
EmX	Emerald Express Bus Rapid Transit
Envision Eugene	Envision Eugene (EE) is the City's draft comprehensive plan. When adopted, it will replace MetroPlan.
EWEB	Eugene Water and Electric Board
FTA	Federal Transit Administration
FTN	Frequent Transit Network: Lane Transit District's desired network of frequent bus routes.

HAWK	High intensity Activated Crosswalk beacon: pedestrian-activated signal used to stop traffic midblock or at unsignalized intersections and allow pedestrians to cross safely.
HSIP	Highway Safety Improvement Program
I-5	Interstate 5
IOF	Immediate Opportunity Fund: ODOT fund created to support primary economic development in Oregon through the construction and improvement of streets and roads.
ITS	Intelligent Transportation System: the use of advanced technologies to improve mobility and enable people to make smarter transportation choices. These may include variable message signs, dynamic car sharing programs or other ways of using wired and wireless technology to improve mobility.
Key Corridors	The six corridors – Highway 99, River Road, Coburg Road, South Willamette, Franklin Boulevard, and West 11th Avenue – that are intended to have frequent transit service connecting downtown to numerous core commercial areas.
Lane ACT	Lane Area Commission on Transportation: an advisory body chartered by the Oregon Transportation Commission responsible for addressing all aspects of transportation (surface, marine, air, and transportation safety) in Lane County with primary focus how the regional system will influence the broader state-wide system.
LCDC	Land Conservation and Development Commission: Oregon's governor-appointed commission charged policy-making related to the state's land use goals
LCOG	Lane Council of Governments
LID	Local Improvement District
LOS	Level of Service: represents a classification of the operational conditions experienced by users of a specified roadway. LOS is determined using a volume to capacity ratio (or degree of saturation) for a given roadway or intersection. LOS categories are designated on an A to F scale with A representing free-flow conditions and F representing a breakdown in vehicular flow.
LRTP	Long Range Transit Plan: Lane Transit District's long range policy plan.
LTD	Lane Transit District
MetroPlan	Regional comprehensive plan (Envision Eugene will replace this plan in Eugene)
MOU	Memorandum of Understanding
MovingAhead	Program initiated by City of Eugene and Lane Transit District to plan and prioritize transportation improvements in Key Corridors.
MPO	Metropolitan Planning Organization (*Central Lane MPO*)
MPU	Master Plan Update for the Eugene Airport

MTIP	Metropolitan Transportation Improvement Program
NEPA	National Environmental Policy Act
NHS	National Highway System
Node	A complete, compact, mixed-use community that includes places to live, work, learn, play, shop and access services. These communities act as nodes, or hubs, for both residents living in the center and people in nearby communities.
ODOT	Oregon Department of Transportation
OHP	*Oregon Highway Plan*
ORS	Oregon Revised Statutes
OTIB	Oregon Transportation Infrastructure Bank
OTP	*Oregon Transportation Plan*
PBMP	Eugene's Pedestrian and Bicycle Master Plan (2012)
PMT	Project Management Team
RRFB	Rectangular Rapid Flashing Beacon: pedestrian-activated signal located at unsignalized intersections or midblock crosswalks that alerts drivers to the presence of pedestrians and their intention to cross the roadway.
RTP	*Regional Transportation Plan*
RTSP	*Regional Transportation System Plan*
SDC	Systems Development Charge
Smart*Trips*	Program to reduce congestion by increasing the number of trips made by walking, biking, busing and carpooling.
SOV	Single-occupancy vehicle
SRTS	Safe Routes to School: program that improves walking and biking routes to schools.
SSM	Supplemental Safety Measures
STIP	Statewide Transportation Improvement Program
STIP-U	Statewide Transportation Improvement Program-Urban
STP-U	Surface Transportation Program-Urban
TAC	Technical Advisory Committee
TAP	Transportation Alternatives Program
TBL	Triple Bottom Line: a decision making framework that considers social equity, economic, and environmental factors.

TCRG	Transportation Community Resource Group: a group of local volunteers that advised on the preparation of this Transportation System Plan.
TDM	Transportation Demand Management: strategies and policies created to reduce or redistribute travel demand on transportation systems, specifically single-occupancy vehicles.
TGM	Transportation and Growth Management: Oregon-based grant program to assist in the planning of streets and land use to create more livable and sustainable communities.
TIF	Tax Increment Financing
TOD	Transit Oriented Development
TPR	Transportation Planning Rule: Oregon policy that dictates that all jurisdictions provide safe, convenient and economic transportation system by reducing per capita vehicle miles traveled through the creation of a TSP.
TransPlan	*The Eugene-Springfield Transportation System Plan*, last amended in 2002
TSAP	Oregon Department of Transportation's Transportation Safety Action Plan, last amended in 2015
TSM	Transportation System Management: tools that use technology to increase the efficiency of the transportation system to minimize the effects of vehicle congestion.
TSMO	Transportation System Management and Operations: programs to optimize the performance of multi-modal infrastructure, preserve capacity, and improve the security, safety, and reliability of transportation systems.
TSP	*Transportation System Plan*
UGB	Urban Growth Boundary
UP	Union Pacific Railroad
V/C	Volume to capacity ratio: this ratio represents the sufficiency of an intersection to accommodate vehicular demand where volume is the peak quantity of vehicles and capacity is the maximum rate at which vehicles can pass through a given point in an hour under prevailing conditions.
Vision Zero	Safety policy that aims to achieve a transportation system with no fatalities or serious injuries.

Chapter 1: Introduction

Transportation: the Backbone of a Community

Welcome to the *Eugene 2035 Transportation System Plan*, or "*2035 TSP*." This document establishes a system of transportation facilities and services that will serve the needs of Eugene residents over the next 20 years. The *2035 TSP* is the transportation element of Eugene's comprehensive land use plan and was designed to support the *Envision Eugene* project, the community's evolving plan for how Eugene will grow for the next 20 years. The *2035 TSP's* planned transportation infrastructure, goals, and policies support an economically vital, healthy, and equitable community.

Put simply, transportation is the movement of people and goods from one place to another. Our transportation systems affect nearly every aspect of city life. We import the basic necessities of life – food, clothing, and building materials – to our homes. A constant flow of freight supplies many aspects of our lives. We travel to work and school, and move about to socialize and play. Streets, rail lines, rivers, and airports create the framework around which our cities are built and help define a city's livability. Our personal choices about how we travel affect our daily lives and our physical and mental well-being. Transportation is truly the backbone that supports a community as it grows and evolves.

The Transportation System Plan defines how the transportation system should change **over the next 20 years** to address the needs of residents, businesses, and visitors.

The plan addresses:

- Roadway, bicycle, pedestrian, transit, air and rail networks
- Transportation project lists and funding
- Transportation policies

A long-term plan for transportation improvements serves community needs efficiently and effectively. For decades the Eugene-Springfield metropolitan area had a shared regional comprehensive plan and regional transportation system plan, known as the *Metro Plan* and *TransPlan* (last comprehensively updated in 2010 and 2002, respectively). These plans guided transportation decisions for both Eugene and Springfield inside a shared urban growth boundary. For both cities, *TransPlan* functioned as the Local Transportation System Plan and the Regional Transportation System Plan. In 2007, the Oregon Legislature passed House Bill 3337, which required Eugene and Springfield to develop separate urban growth boundaries. As a result, Eugene began preparation of a local comprehensive land use plan, the *Envision Eugene* project, and this *Eugene 2035 TSP*. These will be the first comprehensive land use and transportation plans adopted unilaterally by Eugene.

By articulating policies, priorities, and providing a list of construction projects and programs, the *2035 TSP* ensures that Eugene's transportation system meets this community's needs, communicates the City's aspirations, and conforms to state and regional policies. The *2035 TSP* must remain relevant and responsive over time. The City will revisit this *TSP* when *Envision Eugene Comprehensive Plan* is adopted and when conditions change, as evidenced through a monitoring program.

TSP Organization

The City of Eugene's 2035 TSP is comprised of two Volumes: Volume 1, the main document with attachments; and, Volume 2, technical reports, data, and related transportation plans that enhance and support Volume 1.

Volume 1 (this document) includes the items that will be of interest to the broadest audience.

Volume 1 includes:

- Chapter 1: A brief overview of the planning context for the *2035 TSP*
- Chapter 2: Goals, policies and actions that express the City's long-range vision for the transportation system
- Chapter 3: Description of the transportation system deficiencies and needs and the process to develop the TSP's list of planned capital improvements and transportation programs
- Chapter 4: An overview of the recommended projects for the multimodal system
- Chapter 5: A list of the multimodal projects and the costs estimated for their construction
- Chapter 6: A summary of transportation funding and implementation, including estimated revenue stream, cost of 20 year needs, and potential funding sources
- Attachment A: TSP Project Maps
- Attachment B: Street Classification Map (amended)
- Attachment C: Beltline Highway: Coburg Road to River Road Facility Plan
- Attachment D: Alternative Performance Measure Benchmarks
- Attachment E: Freight Maps

Volume 2 includes:

- Appendix A: Existing Conditions Inventory and Analysis
- Appendix B: No Build Analysis
- Appendix C: 20-year Needs Analysis
- Appendix D: Alternatives Evaluation Process
- Appendix E: Key Corridors map
- Appendix F: Eugene Pedestrian and Bicycle Master Plan (2012)
- Appendix G: On the Move: Regional Transportation Options Plan (2014)
- Appendix H: Design Standards and Guidelines for Eugene Streets, Sidewalks, Bikeways and Accessways (1999)
- Appendix I: Eugene Transportation System Plan: Public Involvement Plan
- Appendix J: Lane Transit District Long Range Transit Plan (2014)

- Appendix K: Strategies for Transportation System Management and Operations (TSMO)
- Appendix L: Eugene Airport Master Plan Update (2010)

While not all of Volume 2 is adopted as part of the *2035 TSP*, all of the documents provide useful information regarding the basis for the decisions represented in Volume 1.

Purpose

Envision Eugene, A Community Vision for 2032 recognizes that a future in which people must drive cars for most trips – to work, school, errands and recreation – does not support community goals and values.

The purpose of the *Eugene 2035 Transportation System Plan* (*2035 TSP*) is to establish a system of transportation facilities and services that supports both the City's adopted comprehensive land use plan and *Envision Eugene, A Community Vision for 2032,* articulated in 2012*,* by providing a long-term community approach to accommodate new growth while maintaining and improving transportation facilities for all system users over the next 20 years consistent with the comprehensive plan.

The *2035 TSP* is a resource for future transportation decision-making by articulating the preferred vision for Eugene's future multimodal transportation system. In addition to establishing Eugene's transportation infrastructure with 264 projects planned for the next 20 years, the *2035 TSP* helps future decision making by providing:

- Solutions to address existing and future transportation needs for biking, walking, using transit, driving, freight, and rail;
- A blueprint for investments in transportation projects and programs that provide "complete streets" and improved safety and access for all travelers, reduce the community's contribution to climate change, and improve community resilience in the face of unforeseen changes and an unpredictable future;
- A tool for coordination with regional and local agencies and governments;
- Information to ensure prudent land use and transportation choices;
- Order of magnitude cost estimates for improvements needed to support economic development and growth, and possible sources of funding these improvements;
- Function, capacity and location of future streets, sidewalks, bikeways, high-capacity transit, and other transportation facilities; and
- Potential programs to help improve opportunities to travel by walking, bicycling and transit in the future.

What are Complete Streets?

Complete Streets are streets for everyone. They are designed and operated to enable safe access for all users, including pedestrians, bicyclists, motorists, and transit riders of all ages and abilities. **Complete Streets make it easy to cross the street, walk to shops, and bicycle to work.** They allow buses to run on time and make it safe for people to walk to and from train stations.

The *2035 TSP* satisfies the state's requirements for a local transportation system plan as prescribed by Oregon Statewide Planning Goal 12: Transportation.

Regional Coordination

Because traffic and mobility needs do not stop at a city's borders, several methods of coordinating transportation plans within the Eugene-Springfield Metropolitan area are employed. Staff from Eugene, Springfield, Lane Transit District, and Lane County are advisors on each other's transportation planning committees. Consistency between the transportation system plans of Eugene, Springfield, Coburg, LTD, and Lane County will be assured through the development of an updated *Regional Transportation System Plan* (*RTSP*) to replace the current Eugene-Springfield Transportation System Plan (*TransPlan*). The current *RTSP* considers linkages between the cities', LTD's, and Lane County's transportation systems and will be updated after Eugene adopts its local transportation system plan (Springfield and Coburg having already done so). Among other required elements, in accordance with OAR 660-012-0035, the updated *RTSP* will include new standards to demonstrate how the region is increasing transportation choices and reducing reliance on the automobile.

Sunday Streets is a popular event that invites people to travel without cars.

Source: City of Eugene

In addition to the state-required *RTSP*, the Central Lane Metropolitan Planning Organization (MPO) is responsible for maintaining a federally required *Regional Transportation Plan (RTP).* Central Lane MPO updates the *RTP* every four years. It represents the region's stated transportation investment priorities. Consistency is maintained between Eugene's *2035 TSP* and the *RTP* as each plan is updated periodically.

Public and Agency Involvement

The *2035 TSP* was collaboratively developed by the City and community members, businesses, neighboring cities, ODOT, Central Lane MPO, Lane County, and Lane Transit District. Opportunities for engagement included:

- Project website, www.EugeneTSP.org, that included web-based surveys and all technical reports, draft goals and policies, meeting summaries, a document library stocked by members of the public, and links to other planning activities in the region;
- Twelve Transportation Community Resource Group (TCRG) meetings;
- Public open houses, as well as attending meetings hosted through the *Envision Eugene* process;
- Targeted outreach with local community, neighborhood and social service organizations; and

The TCRG met 12 times to support development of the TSP.

Source: CH2M

- City of Eugene Planning Commission, City Council, and Lane County Board of Commissioners work sessions and public hearings.

Through these public involvement activities, the City provided community members with a variety of forums to identify their priorities for future transportation projects, programs, and policies.

Guiding Principles and Context

The *2035 TSP* provides a flexible, adaptable framework for making transportation decisions in an increasingly unpredictable and financially constrained future. Decisions about the City of Eugene's transportation system will be guided by the goals and policies contained in Chapter 2, but ultimately the decisions will be made within the overall context of the City's land use plans, commitments to address climate recovery, and support for economic vitality. These guiding plans and principles, described in the following sections provide a long-standing foundation for the *2035 TSP's* goals, policies, and potential actions.

Relationship to the *Metro Plan* and *Envision Eugene*

The *2035 TSP* is consistent with the *Metro Plan*, the City's adopted comprehensive land use plan, and supports *Envision Eugene, A Community Vision for 2032,* the 2012 product of a thorough and collaborative planning process that clearly articulates an updated community vision. Both plans promote compact urban development, enhanced neighborhood livability, ample economic opportunities, efficient transportation options, and the means to implement the plans in an adaptable, flexible, and collaborative manner. Like *Envision Eugene, A Community Vision for 2032,* this *2035 TSP* promotes movement toward a sustainable future, one that squarely faces climate change, energy resiliency, and uncertainty.

Envision Eugene, A Community Vision for 2032 provides a framework for the future that promotes new growth along or near Key Corridors and core commercial areas, respects neighborhood character, and increases access to services for all residents. *Envision Eugene, A Community Vision for 2032* provides these seven pillars for future planning:

- Provide ample economic opportunities for all community members;
- Provide housing affordable to all income levels;
- Plan for climate change and energy resiliency;
- Promote compact urban development and efficient transportation options;
- Protect, repair, and enhance neighborhood livability;
- Protect, restore, and enhance natural resources; and
- Provide for adaptable, flexible and collaborative implementation.

What are "Key Corridors"?

Key corridors are defined in the *Envision Eugene, A Community Vision for 2032 (2012)* as "streets that have, or are planned to have, frequent transit service (approximately every 15 minutes or less). This frequent transit service is often accompanied by nearby amenities such as parks, commercial attractions or employment centers, and higher density housing that enable shorter trips and less reliance on the automobile."

Key Corridors identified in *Envision Eugene, A Community Vision* include portions of W 11th Avenue, Highway 99, River Road, 6th and 7th Avenues, Coburg Road, Franklin Boulevard, and South Willamette Street.

The *2035 TSP* updates the City's transportation goals and policies in a manner that is consistent with both its current comprehensive land use plan and with *Envision Eugene, A Community Vision for 2032.*

Triple-Bottom Line Planning

The City of Eugene has a recent history of pursuing sustainable and equitable practices in all its operations. In 2000, the City Council adopted Resolution 4618, which committed the City "to promoting a sustainable future that meets today's needs without compromising the ability of future generations to meet their needs." This resolution states that the "City will ensure that each of its policy decisions and programs are interconnected through the common bond of sustainability as expressed in these principles."

Triple Bottom Line (abbreviated as TBL) is an accounting framework with three parts: social, environmental, and financial. Sometimes called the "three pillars of sustainability," the TBL is a decision-making framework the City of Eugene uses to reach its sustainability goals. This holistic view is grounded in the notion that we must advance social equity, environmental health, and economic prosperity to build a sustainable future for all members of the community. Applying TBL requires that the City explore potential impacts and trade-offs in each of these three areas for a fuller, more complete understanding of how decisions contribute to long-term sustainable development. The *2035 TSP* integrated TBL sustainability principles in every step of its development. The criteria that were used to prioritize potential projects and programs in this plan were broadened to include public health and safety, community context and neighborhood character, climate and energy, and cost effectiveness to ensure that the plan adequately addresses the many aspects of the economy-equity-environment triple bottom line.

Triple Bottom Line planning looks for actions that meet economic, social, and environmental needs.

Source: www.airportsustainability.org

The *2035 TSP*'s expanded view also brought to light other important attributes of the transportation systems, such as perceptions of safety, livability, and compatibility with neighborhood plans.

Equitable Planning and Transportation Services

The *2035 TSP* supports equity and social prosperities in several ways. This plan supports the provision of complete transportation networks that serve all travelers of all ages, abilities, and incomes. Everybody should have safe and efficient access to employment, education, services, and recreation. For example, the ability to afford a car should not be the determining factor in whether a person can be employed. The *2035 TSP* promotes the services and projects that will result in sufficient options to meet these needs. This plan also calls for assurances that costs and benefits of transportation improvements are shared equitably over time, both geographically throughout the City and among populations of different economic strata, races, and ethnicities. The *2035 TSP* empowers community members by encouraging the City to work with local residents, businesses, and other stakeholders to cooperatively develop context sensitive projects that foster the community's active use and sense of ownership of public rights-of-way.

Support for Economic Development

The *2035 TSP* supports the continued growth and vitality of the local and regional economy. Transportation infrastructure investments on key corridors will support the projected employment base and freight movements as well as improve multimodal access to the airport and train station. The *2035 TSP* supports the creation of enhanced transportation corridors by seeing streets as inviting places for people biking, walking, and driving, and as key support for commerce. In this way, "complete streets" will provide integrated transportation networks throughout the City that connect people walking, biking, and taking transit to work, as well as serve cars and the movement of freight.

The *2035 TSP* removes a barrier to planned growth by adjusting Levels of Service for traffic to more realistic levels, levels that reduce reliance on automobile travel and permit levels of development desired by the comprehensive land use plan.

Commitment to Address Climate Change

The City is committed to address climate recovery and reducing fossil fuel consumption. In July 2014, the Eugene City Council adopted a Climate Recovery Ordinance that codified a Council goal of achieving a 50 percent citywide reduction of fossil fuel use by 2030. The goal of reducing fossil fuel use by 50 percent is also a stated goal of the *2035 TSP*.

In addition to the City's adoption of the Climate Recovery Ordinance, from 2013 to mid-2015 the City participated in a scenario planning process led by the Central Lane MPO. The scenario planning process examined how transportation policies might affect equity, public health, economic vitality, and greenhouse gas emissions in the region. The state required the project partners to examine at least one scenario that would achieve a 20 percent reduction (below 2005 emissions levels) in greenhouse gas emissions from light vehicles. Generally, the 20 percent greenhouse gas emission reduction target of the scenario planning study is consistent with the goal of the Climate Recovery Ordinance.

While the preferred scenario selected by the Central Lane MPO is not a statement of regional policy and the strategies are not intended to be directive or regulatory, the *2035 TSP* incorporates and advances many of the strategies identified by the Central Lane MPO as a way of achieving the preferred scenario. Some specific examples of how the *2035 TSP* advances the preferred scenario strategies are as follows:

1. The *2035 TSP* plans for significant investment in active transportation over the next 20 years. (Active transportation strategies #1 & #2.)
    - Of the 264 projects planned in the 2035 TSP to be built over the next 20 years (excluding those to be built upon development), 239 of the projects are entirely pedestrian and bicycle projects; those projects include 89 neighborhood greenways, 22 on-street bike lanes, 18 shared use paths, 12 protected bike lanes, and 85 separated path/sidewalk projects.
    - Six of the 264 projects are transit projects, which include improving frequent transit service and multimodal travel along numerous transit corridors.
    - These 245 bicycle, pedestrian, and transit projects represent 51% of the total transportation dollars that are planned to be spent over the next 20 years.

According to the Environmental Protection Agency, transportation accounts for **28%** of greenhouse gas (GHG) emissions nationally.

- Of the 19 remaining projects, 6 of the projects are complete street upgrades to existing roadways; all 6 of these projects have a significant bicycle and pedestrian component. These complete street projects represent an additional 10% of the total transportation dollars.
- Not counting the three rail projects (which amount for 6% of the total transportation dollars), only three projects planned for the next 20 years have no explicit bicycle, pedestrian, or transit component contained in their project descriptions. These three projects represent approximately 8% of the total transportation dollars that are planned to be spent over the next 20 years.

2. Establishment of a bike share program is currently underway and is one of the *2035 TSP*'s four bicycle policies. (Active transportation strategy #3.)

3. Identified potential action items for meeting *2035 TSP* policy objectives include providing education and awareness programs, such as *SmartTrips* and school-based transportation options (including Safe Routes to School) to improve safety for all travelers and providing support for Safe Route to School programs and other programs that create safe walking conditions between residences and schools and other neighborhood destinations. (Active transportation strategy #5, Education and marketing strategy #1.)

4. A system-wide policy of the *2035 TSP* is fostering neighborhoods where Eugene residents can meet most of their basic daily needs without an automobile by providing streets, sidewalks, bikeways, and access to transit in an inviting environment where all travelers feel safe and secure. The related potential action item is the creation of a strategy to facilitate 90 percent of Eugene residences to be within 20-minute neighborhoods. (Active transportation strategy #6.)

5. The *2035 TSP* policies promote improved transit services that are integrated through context specific multimodal planning for all Key Corridors. One of the four transit policies in the *2035 TSP* is to collaborate with Lane Transit District to provide a network of high capacity, frequent, and reliable transit services, including consideration of Bus Rapid Transit, to the City's identified Key Corridors and to Frequent Transit Corridors as defined by Lane Transit District's Long Range Transit Plan. Additionally, the *2035 TSP* includes $171.4 million in transit projects that support the transit policies and the identified transit needs. (Transit strategies #3 and #4.)

6. The six multimodal/transit projects planned for the next 20 years include the improvement of frequent transit service and multimodal travel along Coburg Road, River Road, Highway 99, 30th Avenue and Amazon Parkway, new transfer stations, and enhanced pedestrian crossings. Additionally, an identified potential action item is to review City Code and amend it if needed to enable additional opportunities to provide bikeways and improved pedestrian connections between key destinations, transit stops, and residential areas with new development and redevelopment. (Transit strategies #5 and #7.)

7. Identified potential action items include aligning the City's land use and parking regulating to encourage walking, biking, and use of public transit and periodically reviewing parking needs in the downtown, Federal Courthouse, and riverfront districts and balance supply with other objectives, such as economic vitality; support for transit, walking, and biking; reduced consumption of fossil fuels; and human-scaled urban form. Additionally, for more than 10 years the City has had in place *Standards for Transportation Demand Management Programs* that provide a mechanism to vary the number of required off-street parking spaces by providing a

strategy for reducing vehicle use and parking demand and using benchmarks to measure program effectiveness. (Parking management strategy #2.)

8. The 2035 TSP recognizes the Regional Transportation Options Plan (RTOP) adopted by the Central Lane MPO as the regional guidance for programs that reduce reliance on single-occupancy vehicles and identifies seven key programs and services, including: SmartTrips individualized marketing programs to encourage active transportation choices; School-Based Transportation Options: Build off existing Safe Routes to School programs to include coordinated program with ridesharing and transit promotion and expand the program to middle and high schools; Rideshare (carpooling and vanpooling); and, LTD's Group Bus Pass program. (Education and marketing strategies #1, 3, and #6.)

The scenario planning studies indicate that, in addition to the steps being taken by the *2035 TSP* to reduce fossil fuel consumption and advance the achievement of the preferred scenario, a wide variety of additional measures will likely be needed to meet the Climate Recovery Ordinance's 50 percent fossil fuel reduction goal; including, additional investment in active transportation (bicycling, walking, and transit); fleet and fuel changes; changes to the pricing structure of fossil fuels, insurance, and parking; additional management of the parking supply; and additional education and marketing efforts.

At the time of this TSP adoption there is significant uncertainty about the tools that will be available for the City to meet this challenge – State consideration of new taxing mechanisms, emergence of self-driving cars and delivery vehicles, advances in electric vehicle technologies, real time information feeds to drivers about alternate routes and available parking spaces, safer street designs, and intelligent traffic control devices are just some of the trends that may impact travel behaviors, fuel consumption, traffic congestion, and emissions. The City will work with community partners and stakeholders to identify and implement the needed strategies for reducing fossil fuel consumption so the strategies will complement and expand upon those already contained in the *2035 TSP*.

Emphasis on Active Transportation

What is Active Transportation?

Active transportation refers to any form of human-powered transportation – **walking, cycling, using a mobility device, in-line skating or skateboarding.** People engage in active transportation in many ways, whether it is walking to the bus stop, or biking to school or work. For some, driving a car is not possible.

Because transit users begin or end their trips on foot or bike, the *2035 TSP* considers transit an active mode, too.

The City's transportation systems should be designed and operated with the needs and safety of all travelers in mind, including people of all ages and abilities, especially the most vulnerable, who are walking, driving, bicycling, using transit, or traveling with mobility aids, some out of necessity.

Toward this end, the *2035 TSP* includes a "Complete Streets" policy that will affect how all streets will be planned and maintained in the future. By making streets more inviting to pedestrians and bicyclists, especially for short trips, the City will gain more efficient use of limited available space within the street rights-of-way, provide a healthier environment in neighborhoods, and support the higher density, mixed use Key Corridors championed by *Envision Eugene, A Community Vision for 2032*.

Improvements to the sidewalk, bicycle, and transit networks make many more travel options available, providing choices that best fit one's travel needs, financial situation, and

location. In furtherance of the goal to increase the number of people choosing active transportation as their travel option, as noted above, there are 245 bicycle, pedestrian and transit projects planned for the next 20 years; these projects representing over 51% of the total transportation dollars that the City plans to spend over the next 20 years.

By planning for the active transportation infrastructure that will make active modes of travel more safe and convenient, the *2035 TSP* is designed to achieve its goal of greatly increasing the number of trips made by transit, bicycling and walking. With the 245 bicycle, pedestrian and transit projects (as well as the six complete street projects) planned for the next 20 years, the *2035 TSP* hopes to (at least) triple the number of trips made by transit, bicycling or walking by 2035.

Public Health

Transportation affects our individual health in many ways: through exposure to air pollution, by affecting the amount of exercise we get, through traumatic crashes, and, all too often, by adding stress. Cumulatively, poor health conditions and injuries create an economic burden on society. Local studies showed significant health benefits when the community invested more in active transportation, transit, education, and marketing programs designed to help people avoid single occupant auto trips.[1]

Active transportation like walking, biking, and taking transit provide healthy alternatives to driving for many trips.

Source: City of Eugene

In November 2015, the City Council adopted Resolution No. 5143 setting as official policy for the City the Vision Zero goal that no loss of life or serious injury on our transportation system is acceptable. In its resolution, the City Council explicitly gave its support to "efforts by the City of Eugene and our regional partner agencies to prioritize safety improvements for people walking, bicycling, and using mobility devices" and to "efforts by the City of Eugene and our regional partners to eliminate deaths and serious injuries on our transportation system, with an emphasis on the most vulnerable users."

Each of the planned projects advance, in some way, the Vision Zero goal by improving the safety of the subject transportation facility for the users. In addition to the many bicycle and pedestrian projects that will improve the user's safety, such as the grade separated path/sidewalk projects and the protected bike lane projects, proposed improvements to our current roadways will also advance user safety goals. For example, the complete street upgrade projects will improve the roadway for all users and the adoption and construction of the Randy Papé Highway Facility Plan recommendations for improvements to the Randy Papé Beltline Highway and Delta Highway will improve the safety of those facilities, both of which have segments identified by ODOT as having Safety Priority Index System (SPIS) scores in the top 10 percent. (ODOT's SPIS score is based on crash rate, frequency and severity over the prior three years.) In all, implementation of the *2035 TSP* will result in improved safety from crashes, safer sidewalks and bike facilities, slower vehicular speeds, and better pedestrian crossings on busy streets.

[1] Central Lane Scenario Planning, 2015.

Regulatory Framework and Relationship to Other Plans and Policies

Oregon Transportation Planning Rule

The Oregon Transportation Planning Rule (TPR), Oregon Administrative Rule 660-012-0000, implements Statewide Planning Goal 12: Transportation, "To provide and encourage a safe, convenient and economic transportation system." The purpose of the TPR is to direct transportation planning in coordination with land use planning. One requirement of the TPR is that cities adopt local transportation system plans for the lands within a city's planning jurisdiction that establish a coordinated network of transportation facilities and services adequate to meet identified local transportation needs. In establishing that coordinated network of facilities and services, local transportation system plans must include a number of elements such as a road plan for a system of arterial and collector streets and a bicycle and pedestrian plan.

Eugene-Springfield Transportation System Plan (*TransPlan*)

Until now, *TransPlan*, adopted as a functional plan to the Eugene-Springfield Metropolitan Area General Plan (*Metro Plan*), served as the City's regional transportation system plan (RTSP), local transportation system plan, and pedestrian and bicycle master plan. While *TransPlan* will continue to serve as the City's RTSP, the *2035 TSP* will serve as the City's local transportation system plan.[2] As discussed further below, the *2035 TSP* will also serve as the City's pedestrian and bicycle master plan.

In satisfaction of the TPR's requirement to increase transportation choices and reduce reliance on the automobile (OAR 660-012-0035), the *2035 TSP* supports and advances the alternative performance standards approved by LCDC in 2001 and adopted as part of *TransPlan*. In furthering the goals of the 2001 standards, the *2035 TSP* builds upon the lessons learned since 2001, and recognizes that there are new, innovative ways to decrease vehicle miles of travel. To that end, the *2035 TSP* uses terminology that, at times, slightly differs from the terminology adopted in 2001, but nevertheless advances the achievement of the standards approved by LCDC in 2001.[3] For example, the City no longer uses the term "nodal development" in its land use and transportation planning efforts. Instead, the City uses terms such as "key corridors" and "20-minute neighborhoods." Despite a shift in terminology, the underlying concept, goals, and benefits of nodal development remain unchanged; providing land use patterns so that walking, cycling, and use of transit are highly convenient and so that, on balance, people need to and are likely to drive less than they do today. Most importantly, the *2035 TSP* is designed to increase transportation choices and reduce reliance on the automobile.[4]

---

[2] The *2035 TSP*, including the project lists set forth in Chapter 5, does not have any legal or regulatory effect on land or transportation facilities that the City does not own. However, in order to adequately evaluate system alternatives, the City's planning process evaluated some facilities that are not under the City's jurisdiction. As such, the *2035 TSP* includes proposed improvements to non-City facilities. Without additional action by the governmental entity that owns the subject facility or land (*e.g.*, Lane County or State of Oregon) any project in this *2035 TSP* that involves a non-City facility or land is merely a recommendation. As in most facility planning efforts, moving towards, and planning for, a well-connected network depends on the cooperation of multiple jurisdictions; the *2035 TSP* is intended to facilitate discussions between the City and its governmental partners as we work together to achieve a well-connected network. The *2035 TSP* does not, however, obligate its governmental partners to take any action or construct any projects.

[3] In accordance with OAR 660-012-0035(7), the *2035 TSP* includes benchmarks to assure that the City is making satisfactory progress toward meeting the standards approved by LCDC in 2001. Those benchmarks are set out in Attachment D.

[4] The *2035 TSP*'s design to increase transportation choices and reduce reliance on the automobile will most likely advance any new regional standards that are adopted as part of the RTSP update, however, if needed, the *2035 TSP* will be amended to address the new regional standards.

Comprehensive Plan

While reflective of Eugene's current planning work, the 2035 TSP is a component of the *Metro Plan* and is being concurrently adopted as part of the *Metro Plan*. Because preparation of the *2035 TSP* was originally a part of the larger planning process that will eventually result in the adoption of Envision Eugene Comprehensive Plan (EECP), it is anticipated that the *2035 TSP* will eventually serve as a component of the EECP and will be adopted, with amendments, as the transportation chapter of the EECP.

Pedestrian and Bicycle Master Plan

On March 12, 2012, the Eugene City Council accepted the 2012 Eugene Pedestrian and Bicycle Master Plan (PBMP) and directed the City Manager to integrate the PBMP into the *2035 TSP*. Consistent with the TPR's requirement that transportation system plans include a bicycle and pedestrian plan for a network of bicycle and pedestrian routes and that transportation system plans be designed to increase transportation choices and reduce reliance on the automobile, the PBMP's goals, key policies, and projects are woven throughout the *2035 TSP* and function as an integral part to making walking and cycling highly convenient. As such, in addition to the *2035 TSP* serving as Eugene's local transportation system plan, the *2035 TSP* also serves as Eugene's bicycle and pedestrian master plan.

Related Plans, Manuals, and Rules

The *2035 TSP* is the City's long-range planning document that establishes a system of transportation and services that will meet the identified needs of the City over the next 20 years. In addition to the *2035 TSP,* the City has adopted a number of plans, manuals, and administrative rules that relate the provision of transportation facilities to the public.[5] The City's current transportation-related plans, manuals, and administrative rules, include (but are not limited to):

- Street Classification Map;
- Street Right-of-Way Map;
- Design Standards and Guidelines for Eugene Streets, Sidewalks, Bikeways & Accessways;
- Public Improvement Design Standards Manual;
- Utility and Right-of-Way Permits, Construction Within and Use of the Public Way, Policies and Procedures Manual;
- 2010 Airport Master Plan;
- Standards for Traffic Impact Analysis Review; and,
- Standards for Transportation Demand Management Program.

[5] Some of the listed documents satisfy specific provisions of the TPR and are explicitly discussed in the *2035 TSP*. For example, the City's Street Classification Map, Street Right-of-Way Map, and *Design Standards and Guidelines for Eugene Streets, Sidewalks, Bikeways & Accessways* collectively satisfy the required road plan setting forth a system of arterials and collectors and standards for the layout of local streets and other important non-collector street connections. *See* OAR 660-012-0020(2)(b) and Appendix H in Volume 2.

The *2035 TSP* recognizes that certain transportation-related regulations need updating. Some of the above-listed documents will be amended concurrently with the adoption of the *2035 TSP* (such as the Street Classification Map); other documents will undergo a longer update process and will be amended after the adoption of the *2035 TSP* (such as the *Design Standards and Guidelines for Eugene Streets, Sidewalks, Bikeways & Accessways*).

There are other City-adopted plans and policies that, while not solely related to the provision of transportation facilities to the public, nevertheless play an important role in the City's long-range transportation planning. Some of those other plans and policies, such as the Climate Recovery Ordinance and the Triple Bottom Line framework, are explicitly discussed in the *2035 TSP.* Also recognized and incorporated into the *2035 TSP* is the City Council's adoption of Resolution No. 5143 which sets as official policy for the City the Vision Zero goal that no loss of life or serious injury on our transportation system is acceptable.

In addition to the multi-jurisdictionally adopted Eugene-Springfield Transportation System Plan (*TransPlan*), there are a number of regional transportation planning documents and planning documents adopted by one of the City's governmental partners that inform, guide, and, in some cases, have regulatory significance to the City's transportation planning efforts. Those other transportation planning documents include (but are not limited to):

- Central Lane MPO Regional Transportation Plan (RTP);
- Lane County Transportation System Plan;
- Springfield 2035 Transportation System Plan;
- Oregon Highway Plan;
- Regional Transportation Options Plan; and,
- LTD Long Range Transit Plan.

Financial Environment

A combination of federal, state, county, city, and private funds have traditionally supported transportation capital improvements. While this remains the case, the funding arrangements at both the state and national levels are less predictable than in the past. The recent national recession, reduction of federal subsidies for timber counties, state-legislated revenue dedicated to discrete projects, the overhaul of the State Transportation Improvement Program (STIP), and Congress' move away from federal earmarks for infrastructure have all combined to make revenue forecasting an uncertain exercise. Today, as in the past, revenue streams are insufficient to address both the backlog of maintenance needs across Oregon and future transportation investments that support the economic growth, health, and wellbeing of its communities. Given these funding uncertainties, it is nearly impossible to forecast accurately how much funding is likely to be available for transportation investments over the 20-year life of this plan.

In this context of future uncertainties, Eugene's *2035 TSP* provides a prudent list of construction projects, emphasis on lower cost methods of improving personal mobility within the City, and increased reliance on technologies that will improve the efficiencies of our streets. The project lists in Chapter 5 allow the City the flexibly to make wise investments and to leverage opportunities as they arise, such as when there are:

- Changes in policy or funding at the federal, state, or local level;
- Different local development priorities;
- Future conditions that differ from predictions in the *Metro Plan*; *Envision Eugene, A Community Vision for 2032*; this *2035 TSP;* or regional plans; or
- New public-private or public-public partnerships.

Chapter 2: Goals, Policies, and Actions

The *2035 TSP* is an internal policy document that provides the City of Eugene with a coordinated guide for changes to its transportation infrastructure and operations over a 20 year period of time. The *2035 TSP* was crafted to conform to the *Metro Plan*'s land use diagram and *Envision Eugene, A Community Vision for 2032* (2012).

A basic assumption in the development of this policy document is that transportation systems do more than meet travel demand: they have a significant effect on the physical, social, and economic characteristics of the areas they serve. Transportation planning must be viewed in terms of regional and community goals and values such as protection of the environment, impact on the regional economy, and maintaining the quality of life that area residents enjoy and expect.

A major component of this policy document is the goals, policies, and lists of possible action items. These terms are defined below.

- **Goals** are broad statements of philosophy that describe the hopes of the people of the community for the future of the community. A goal is aspirational and may not be fully attained within the 20-year planning horizon of this plan.
- **Policies** are statements adopted to provide a consistent course of action and move the community toward attainment of its goals. Policies in the *2035 TSP* guide the work of the City Manager and staff in formulating proposed changes to the Eugene Code and other regulatory documents, to guide other work programs and long range planning projects, and preparation of the budget and capital improvement program. These policies will not be used in determining whether the City shall approve or deny individual land use applications. Each set of policies may be followed by action items that could be employed to help implement one or more of the policies within the set.
- **Potential Actions** offer direction to the City about steps that could implement adopted policies. Not all policies include action items and not all potential actions are listed. Rather, the identified potential actions outline specific projects, standards, or courses of action that the City or its partner agencies could use to implement the *2035 TSP*. These actions can provide guidance for decision-makers and will be updated over time.

Goals

Goal 1: Create an integrated transportation system that is safe and efficient; supports the *Metro Plan*'s land use diagram, *Envision Eugene, A Community Vision for 2032* (2012), the City of Eugene's target for a 50 percent reduction in fossil fuel consumption, and other City land use and economic development goals; reduces reliance on single-occupancy automobiles; and enhances community livability.

Goal 2: Advance regional sustainability by providing a transportation system that improves economic vitality, environmental health, social equity, and overall well-being.

Goal 3: Strengthen community resilience to changes in climate, increases in fossil fuel prices, and economic fluctuations by making the transportation networks diverse, adaptable, and not reliant on any single mode.

Goal 4: Address the transportation needs and safety of all travelers, including people of all ages, abilities, races, ethnicities, and incomes. Through transportation investments, respond to the needs of system users, be context sensitive, and distribute the benefits and impacts of transportation decisions fairly throughout the City.

Goal 5: By the year 2035 triple the percentage of trips made on foot, by bicycle, and by transit from 2014 levels.

System-Wide Policies

LTD buses include bike racks to allow users to combine modes of travel.

Source: Lane Transit District

1. Foster neighborhoods where Eugene residents could meet most of their basic daily needs without an automobile by providing streets, sidewalks, bikeways, and access to transit in an inviting environment where all travelers feel safe and secure.
2. Consider safety first when making transportation decisions. Strive for zero transportation-related fatalities and severe injuries by reducing the number and severity of crashes through design, operations, maintenance, education, and enforcement. In furtherance of the City Council's adopted Vision Zero goal (Resolution No. 5143), prioritize safety improvements for people who walk, bike and use mobility devices because no loss of life or serious injury on our streets is acceptable.
3. Improve community health by designing streets and paths to encourage increased physical activity by the public.
4. Promote connections between modes of transportation to make each mode more efficient, such as by connecting bicycle routes and bus, train, and airport services to each other; and connections to transportation facilities extending outside the City's planning area.
5. The Regional Transportation Options Plan (RTOP) adopted by the Central Lane MPO Metropolitan Policy Committee is recognized as the regional guidance for programs that reduce reliance on single-occupancy vehicles.

Potential Actions for System-Wide Policies

A. Create a transportation work plan that prioritizes implementation and funding for transportation projects and programs within the *2035 TSP* 20-year planning period.

B. Review and amend City codes where needed to enable additional opportunities to provide bikeways and improved pedestrian connections between key destinations, transit stops, and residential areas with new development and redevelopment. Create opportunities for public review of new development and new or redeveloped schools at early stages of site development to improve multimodal access and circulation.

C. Create a strategy to facilitate 90 percent of Eugene residences to be within "20-minute neighborhoods." The strategy might include methods to improve proximity of residences to services and prioritizing projects that improve convenience and safety for walking, biking, and connections to transit stops.

D. Develop local metrics that may be applied when the land use and transportation system characteristics would indicate a tendency for a development or area to generate fewer motorized vehicle trips than would be predicted by using national standards, such as for mixed-use development, areas served by frequent transit, and areas with Transportation Demand Management agreements.

E. With Lane County Public Health Department, identify mutual objectives and opportunities to collaboratively promote bicycle and pedestrian activities, reduce injury crashes and fatalities, integrate health considerations into transportation decisions, and improve emergency medical systems.

F. Develop a Memorandum of Understanding (MOU) with Lane County Public Health Department for sharing data and analysis on traffic-related injuries and traumas.

G. Focus police traffic enforcement efforts on Driving Under the Influence of Intoxicants, failure to stop for red lights and stop signs and obey traffic control devices, violation of posted speed limits, distracted driving (*e.g.*, texting while driving), failure to wear seatbelts, and failure to stop for pedestrians in crosswalks.

H. Work with the Oregon Department of Motor Vehicles (DMV) to revise driver's license tests to be more inclusive of rules pertaining to walking and biking.

I. Implement the *ADA Transition Plan for Public Right of Way* to bring all pedestrian access routes within sidewalks and other pedestrian circulation paths in the right-of-way into compliance with Americans with Disabilities Act (ADA) requirements.

J. Continue to review and amend standard conditions for traffic control, permit approval procedures, and design standards, as necessary, to ensure safe, barrier-free passage through and adjacent to construction zones.

K. Evaluate City streets for opportunities to lower speed limits when doing so will make the street safer for one or more modes of transportation and not make it less safe for any other mode.

L. Strengthen the City's traffic calming program by increasing the annual funding amount. Continue to consider input from the Fire Department regarding acceptable traffic calming treatments.

M. Create and regularly use a robust, systemic method of measuring trips made by walking, biking, and driving.

N. Promote transportation demand management programs along the Key Corridors, in downtown, and near the University of Oregon to coordinate the needs and travel options of multiple businesses and residences for purposes of reducing automobile and freight demand at times of peak congestion. These programs could be staffed by either a public agency, a business association, or by training individuals within the affected businesses and housing to perform this work.

O. Create "Mobility Hubs" near transit stations.
P. Provide education and awareness programs, such as Smart*Trips* and school-based transportation options (like Safe Routes to School), to improve safety for all travelers and encourage use of active transportation.
Q. Align the City's land use and parking regulations to encourage walking, biking, and use of public transit; more efficient use of land; and lower transportation and housing costs while accommodating the growth and economic prosperity espoused by the comprehensive land use plan.
R. Monitor advancement toward achieving the goals of this plan. Coordinate progress reports with scheduled updates to the Regional Transportation Plan made by the Central Lane MPO. Make progress reports available to the public.
S. Collect and report crash data for all travel modes and use the data to inform capital and maintenance projects to enhance safety and engineering changes to existing infrastructure.
T. Support programs recommended in the Regional Transportation Options Plan.
U. Prepare an assessment of the City's current safety efforts, recommendations for actions to take to improve transportation safety, and an implementation plan for those actions. The assessment should include a framework for screening all transportation projects for consistency with adopted policies.
V. Translate educational materials to other languages to broaden their effectiveness.
W. Complete a Vision Zero Action Plan to achieve the goal of zero transportation-related fatalities and severe injuries by a target date to be recommended by the Vision Zero Task Force.

What is a "Mobility Hub"?

Mobility hubs are a concentration of transportation services near transit stations that may include Wi-Fi technologies, pocket maps/brochures, secure bicycle parking, car- and bike-share services, shuttle service, and other assistance for the traveling public.

Transit Policies

1. Promote the use of public transit and the continued development of an integrated, reliable, regional public transportation system.
2. Prioritize improved transit service in Key Corridors and other areas with sufficient employment, activities, or residential density that best support transit service and transit services that connect residents to employment centers. If operational funding is sufficient, extend transit to support higher density housing and employment development planned for other areas.
3. Align transit services with community needs by engaging the broader community in determining the role transit service will play in Eugene's future; creating strategies that leverage capital investment to deliver the desired services and facilities; and identifying and pursuing the most effective, stable, and equitable sources of local funding for transit operations.
4. Collaborate with Lane Transit District to provide a network of high capacity, frequent, and reliable transit services, including consideration of Bus Rapid Transit, to the Key Corridors as identified in *Envision Eugene, A Community Vision for 2032* (2012) and to Frequent Transit Corridors as defined by Lane Transit District's *Long Range Transit Plan*.

Potential Actions for Transit Policies

A. The actions anticipated to implement Key Corridors and regional Frequent Transit Networks include the following:

- Describe a comprehensive process to be used for planning Key Corridors.
- Analyze Key Corridors and Frequent Transit Network routes, as identified in *Envision Eugene, A Community Vision for 2032* (2012) and *Long-Range Transit Plan*, for their potential to provide frequent transit service and identify transit's role in supporting development within each corridor.[6] In each Key Corridor, bus rapid transit (*e.g.*, "EmX"-style of transit service) should be considered as an option.
- Engage members of the community in establishing neighborhood travel needs and priorities within each corridor, leading to proposed context sensitive solutions that meet these needs.
- Conduct coordinated land use and transportation studies for each Key Corridor to determine the appropriate balance of transportation access for each mode of travel, location and density of new development, location of activity centers, right-of-way needs, building setbacks, and locations of major transit stops.

Review and amend parking standards, as necessary, for each corridor to reflect the presence of frequent transit service and reduced demand for automobile trips.

- Design standards should be created for the pedestrian zone and for properties adjacent to the corridor to encourage pedestrian- and transit-oriented development and to provide safe and convenient pedestrian and bicycle access to transit stops.

What is Bus Rapid Transit?

Bus Rapid Transit (BRT) is the highest level of service available within Lane Transit District's Frequent Transit Network. **Locally BRT service is known as "EmX."**

BRT is a permanent, integrated system that uses buses on roadways or in dedicated lanes to efficiently transport passengers. BRT system elements include bus only lanes, stations, vehicles, fare collection, intelligent transportation systems, and branding elements that can be easily customized to community needs, and result in higher ridership and less delay.

EmX Stations include amenities to make taking transit more comfortable and convenient.

Source: Lane Transit District

[6] In 2015, the MovingAhead program was initiated by the City of Eugene and the Lane Transit District to plan and prioritize transportation improvements in the Key Corridors. Each corridor will be examined individually to understand what types of investments are needed for people using transit, biking, and walking to meet their transportation needs and support vibrant places.

B. Coordinate with Lane Transit District (LTD) to expand the park-and-ride system within Eugene's commute shed with an emphasis on developing partnerships to share existing parking facilities.

C. Consider transit-preferential measures at intersections to improve travel time reliability and reduce delays. These include transit signal priority, queue jump lanes, curb extensions for loading, and other such practices. These options should be balanced against the potential interference with bike lanes, delays to pedestrian crossings, and safety for all travelers. Work with LTD to provide safe and convenient pedestrian and bicycle access and amenities by transit stops, including bike share stations and secure bike parking.

D. Work with LTD to evaluate opportunities to use SDCs and other local funding sources to support transit improvements.

What is the Frequent Transit Network?

Lane Transit District's Long Range Transit Plan (2014) describes the Frequent Transit Network (FTN), as a **regional initiative to better connect areas of more active development to transit.** The FTN will have the following characteristics:

- A well-connected network that provides regional circulation.
- Compatible with and supportive of adjacent urban design goals.
- Operates seven days a week in select corridors.
- Service hours are appropriate for the economic and social context of the area served.
- Coverage consists of at least 16 hours a day and most area riders' trip origins or destinations are within ¼ of a mile straight line distance.
- Average frequency of 15 minutes or better.
- Transit stops and stations are of high quality with amenities, including bicycle and pedestrian connections to stations and end-of-trip facilities, such as bike parking.

Roadway and Parking Policies

1. ["Complete Streets Policy"] Design, construct, maintain, and operate all streets to provide comprehensive and integrated transportation networks that serve people of all ages and abilities, promote commerce, and support the comprehensive land use plan's vision for growth and development in a responsible and efficient manner. A "complete street" allows safe travel for automobiles and emergency responders, bicycles, walking, transit, and freight. In addition to fulfilling a street's basic transportation functions and providing access to properties, streets and sidewalks should be designed to be attractive, safe, accessible, sustainable, and healthy components of the City's environment.
2. Improve connectivity and address deficiencies in the street network, both inside the Urban Growth Boundary and connecting to neighboring cities, with the understanding that connectivity needs may differ based on an area's planned land uses (*e.g.*, large lot industrial areas may have different needs than residential areas).
3. Improve travel time reliability between key origins and destinations for transit, regional freight movement, and other trips for which on-time arrivals are important.

4. Facilitate prompt emergency responses. Ensure that fire and emergency response routes remain passable by design.
5. Plan for, design and construct or reconstruct streets to achieve consistency between motorists' speeds and target speed limits. Use motor vehicle Level of Service (LOS) standards to evaluate acceptable and reliable vehicular performance on the City's and County's local, collector and arterial streets. Recognize ODOT's mobility targets (based on volume to capacity or V/C) for state facilities. Because mobility targets from the Oregon Highway Plan (OHP) are applied on state facilities, the City will seek Oregon Transportation Commission (OTC) amendment of the OHP to include alternative mobility targets at the locations identified in the local standards.
6. Continually optimize the efficiency of the transportation system through transportation system management (TSM) improvements, connectivity improvements, multimodal improvements, parking management and supply, and Transportation Demand Management (TDM) strategies, in combination with the projects identified in this TSP.
7. Facilitate efficient access for goods, employees, and customers to and from employment, commercial, and industrial lands, including freight access to designated freight routes, highways, rail yard, and the Eugene Airport. Increase multimodal access for employees to employment centers.
8. Support ODOT's efforts to improve Randy Papé Beltline Highway for transportation system efficiency, improved safety, and improved connections for people travelling by foot, bike, and bus. The *Beltline Highway: Coburg Road to River Road Facility Plan* is incorporated into this TSP, contained in Volume 1. The City of Eugene supports completion of the NEPA review, and implementation of the resultant recommended improvements.
9. Prior to moving forward with a capital project including Complete Street Upgrades of Existing Streets and in addition to conducting public engagement activities, staff will also consider a neighborhood's character (the built and natural environment) and other elements of community context when designing the project.

What is "travel time reliability"?

Travel time reliability is a consistency or dependability in travel times as measured from day to day or across different times of day. Travelers want to know that a trip will take a half-hour today, a half-hour tomorrow, and so on.

Actions for Roadway Policies

A. Amend the City's adopted Traffic Impact Analysis code and administrative rule provisions to expand the measurement of a proposed development's traffic impacts beyond the level of service measurement and, correspondingly, expand potential mitigation measures beyond measures that address only vehicular delay.
B. Amend the Traffic Impact Analysis provisions to require a review of safety at intersections through a comparison of the actual crash rate experienced during the past 3-5 years versus the expected crash rate for similar facilities to determine whether improvements may be needed.
C. Require all developments and employers of a certain size and type to prepare, implement and monitor Transportation Demand Management (TDM) plans.

Potential Actions for Roadway and Parking Policies

A. Consider roundabouts for new development in any situation where capacity, congestion, delay, crash history, or turning conflicts would otherwise support traffic signal installation. Roundabouts should be actively considered for retrofit at existing signal locations when major reconstruction is planned.

B. Preserve rail corridors, alleys, accessways, and pedestrian and bicycle easements that can provide desired connections within the transportation network or have potential to serve transportation purposes in the future.

C. Continue to maintain and implement the Street Classification Map, the Right of Way Map and the *Design Standards and Guidelines for Eugene Streets, Sidewalks, Bikeways and Accessways*.

D. Update City design standards, as necessary, to address emergency vehicle passage on officially recognized emergency response routes and consider accommodations for Fire Department Ladder Operations where tall buildings exist or are planned. Involve emergency responders in changes to street designs.

E. Articulate a process for implementing the complete streets policy, including responsibilities for decision making, public review, opportunities for appeals of decisions, the means of documenting and justifying decisions, and the collection and reporting of data that allows monitoring the effects of street design changes over time.

F. Update the Eugene *Design Standards and Guidelines for Eugene Streets, Sidewalks, Bikeways and Accessways* to implement the "complete streets policy" by:

- Recognizing these attributes as integral parts of the planning, design, and programming for public streets and rights-of-way:
  - The safety for those traveling in the public right-of-way, including the most vulnerable people of all ages and abilities.
  - The convenience of all users of the transportation system.
  - The importance of making walking and biking the most efficient, convenient, safe, and comfortable method of travel for trips of up to half a mile and up to 2 miles, respectively.
  - Adopted plans that state a preference for a mode of travel in a specific location, such as transit in Frequent Transit Corridors, emergency services on Emergency and Fire Response routes, trucks on designated freight routes, and bicycles on facilities described in Chapter 5.
  - Balancing traffic flow with the street experience, safety, and needs of other users within the streetscape.
- Articulating circumstances that may require that the complete streets policy be achieved incrementally through a sequential series of smaller improvements rather than by incorporating all elements into a single construction project.
- Articulating a process for determining when conditions inherent to a specific project may make application of the complete streets policy difficult or superfluous, such as when all

modes of travel are adequately served in an area by separate, complementary networks, or where a mode of travel is prohibited.

G. Work with developers to complete the major street network as shown in the Arterial and Collector Street Map. The City will fund its share of these improvements through System Development Charges and other funding sources.

Shared roadways are one type of facility that serve both cyclists and drivers.

Source: City of Eugene

H. Expand methods of providing real-time traveler information to the public, such as by:
   - A smartphone application to alert drivers of travel time delays and alternate routes.
   - Informational reader board signs along freight routes.
   - Increased awareness of existing programs and services (*e.g.,* through rideshare campaigns, Sunday Streets events, transportation fairs, and community events).
   - Enhanced online rideshare platforms for multiple networks, including closed rideshare networks to serve targeted groups (*e.g.*, Kidsports and special events) and dynamic ridesharing options that serve the general public.
   - Centralized data pool for emerging technologies that require public transportation data (*e.g.,* transit real-time information) and infrastructure data (*e.g.,* street and parking data) that is available for use by public and private sectors.
   - An app that directs drivers to open parking spaces.

I. Implement Intelligent Transportation Systems (ITS) and other technologies to improve traffic safety, such as:
   - Upgraded signal coordination and abilities for signals to adjust to real-time traffic conditions.
   - Upgraded traffic signals to include accessible pedestrian devices (APD).
   - Ramp metering (by ODOT).
   - Variable speed limits that respond to increasing congestion.

J. Review and update procedures for incident/crash detection and clearing roads to reduce traffic delay while maintaining a safe environment for incident responders.

K. Review and update as necessary the Eugene Code and policies for access management and street connectivity standards to enhance safety and operational efficiency for all modes of travel on streets and sidewalks.

L. Periodically review and update the City Code and administrative rules in the downtown area, neighborhoods near the University of Oregon, mixed-use centers, and in areas experiencing changing conditions, such as where a transit corridor study has been completed, transit routes

changed, or major bicycle facilities completed. Examples of possible changes to the code and policies may include:

- Requiring or allowing fewer parking spaces where conditions would allow less driving.
- Disconnecting the price of a residential parking space from a unit's rent.
- Aligning metered parking prices with demand.
- Facilitating conversion of on-street automobile parking spaces to bicycle lanes, bike parking, or expanded pedestrian and ground-level business amenities.
- Aligning land use and design standards at major transit stops to support transit ridership.
- Requiring ongoing transportation demand management (TDM) for large attractions and employment centers at times and locations where such measures are necessary to reduce congestion or optimize limited parking.

M. Change the configuration of some streets to encourage slower vehicle speeds.

N. Work with ODOT to provide sufficient access along Highway 99 to facilitate redevelopment of adjacent properties as a Key Corridor.

O. Collaborate with ODOT on the implementation of the Beltline Facility Plan and NEPA project. Amend the *2035 TSP* to reflect the recommended policies and projects of these efforts.

P. Explore methods of describing multimodal levels of service that address the City's desire for a safe and convenient multimodal transportation system.

Q. Work with ODOT to seek alternative mobility targets that align with City policies.

R. Consider converting to two-way traffic Charnelton Street between 11th and 13th Avenues, Lincoln Street from 5th Avenue to 11th Avenue, and Lawrence Street from 6th Avenue to 13th Avenue.

S. Periodically review parking needs in the downtown, Federal Courthouse, and riverfront districts and balance supply with other objectives, such as economic vitality; support for transit, walking, and biking; reduced consumption of fossil fuels; and human-scaled urban form.
Expand the definition of LOS to include volume-to-capacity ratio, queuing, and traffic control changes.

Pedestrian Policies

1. Encourage walking as the most attractive mode of transportation for short trips (*e.g.*, within one half miles) within and to activity centers, downtown, key corridors, and major destinations, and as a means of accessing transit.
2. Ensure that there are safe, accessible, comfortable, and direct sidewalk connections between residential areas, major destinations, and transit stops. Continually improve walking comfort, safety,

and accessibility through design, operations, retrofits, and maintenance. Provide landscaped setback sidewalks of ample width and safe street crossings to encourage people to walk.

3. Coordinate improvements to complement and improve the systems proposed in the Eugene Trails Plan and connections to regional trails.

Midblock crossing assist pedestrian in safely crossing roads. All intersections contain crosswalks, whether they are marked or not.

Source: City of Eugene

Potential Actions for Pedestrian Policies

A. Maintain a map and project list for desired improvements to the pedestrian network within the life of this plan. Provide priorities among these projects, yet provide flexibility among priorities to respond to unforeseen opportunities and development.

B. Provide street crossing enhancements and expanded crosswalk education and enforcement programs.

C. Provide support for Safe Routes to School programs and other programs that create safe walking conditions between residences and schools and other neighborhood destinations.

D. Review the Eugene Code for additional opportunities to require sidewalk connections between new development and redevelopment and existing sidewalks and transit.

E. Amend the Eugene Code (*e.g.*, EC 9.6505) and policies to consistently require sidewalk installation throughout newly divided and developed lands, such as by requiring sidewalk construction concurrent with street improvements or by bonding for completion of the sidewalks if development on individual lots does not fill in the system in a reasonable amount of time.

F. Maintain a sidewalk infill and improvement program that considers new funding sources, credits and loans, and expanded development requirements to complete missing sidewalk segments, to avoid creating gaps in sidewalk networks in new development areas and to upgrade existing sidewalks in high traffic areas to provide needed width, landscaping, and removal of barriers, and to implement the City's Americans with Disability Act program.

G. Continue to ensure that Systems Development Charges (SDCs) consider walking and pedestrian improvements as important components of the overall, integrated transportation system.

H. Update Eugene's Traffic Impact Analysis review regulations for new development to include review of walking and biking improvements and connections to nearby networks.

Bicycle Policies

Eugene aims to accommodate bicyclists of all riding abilities and levels of comfort on city streets and facilities.

Source: City of Eugene

1. Create conditions that make bicycling more attractive than driving for most trips of two miles or less.
2. Develop a well-connected and comfortable bikeway network. Ensure that there are safe, comfortable, and direct bikeway connections between residential areas, major destinations, and transit stops and provide secure bicycle parking facilities at these destinations.
3. Continually improve the comfort and safety of bicycling through design, operations, retrofits, and maintenance. Identify and develop "low stress" bikeways to attract new cyclists.
4. Support a Eugene bike share system.

Potential Actions for Bicycle Policies

What are "Low-stress" bikeways?

Low-stress bikeways are facilities that **feel safe and inviting to many people, including children and the elderly,** who may choose to bike. Low stress bikeways are generally separated from heavy vehicular traffic or share the road with motorists only on very low-volume residential streets, are well signed, and connected to popular destinations.

A. Maintain a map and project list for desired improvements to the bicycle network within the life of this plan. Provide priorities among these projects, yet provide flexibility among priorities to respond to unforeseen opportunities and development.

B. Support Safe Routes to School programs and other programs that create safe bicycling conditions between residences and schools and other neighborhood destinations.

C. Ensure that Systems Development Charges (SDCs) consider biking and bicycle improvements as important components of the overall, integrated transportation system.

D. Evaluate and adjust traffic control systems to balance bicycle travel with other modes along strategically chosen bicycle routes.

E. Provide high quality, flexible and secure bicycle parking, and ensure through project design and standards that bicycle parking is considered when parks, schools, and other public facilities are planned.

F. Review Eugene Code parking and redevelopment standards for opportunities to improve requirements for support facilities for employees who are commuting by bike, such as by providing showers, lockers, and secure covered bike parking.

G. Provide incentives for businesses and other entities to add or upgrade bicycle parking facilities and amenities beyond minimum code requirement requirements (or to bring them up to code in cases where properties were developed under previous standards) or to provide bike share facilities.

H. On a case-by-case basis reallocate space within street rights-of-way to enhance bikeways and pedestrian environments (*e.g.*, converting parking or travel lanes). Priority areas for bikeway improvements include areas near the University of Oregon, downtown Eugene, streets connecting residential areas to schools and commercial hubs, and streets. It is expected that ODOT facilities and Key Corridors will be analyzed under separate comprehensive planning processes than other streets.

Rail, Freight, and Pipeline Policies

1. Promote the efficiency with which freight and deliveries are transported without worsening impacts to the environment, social and neighborhood context, promotion of "Complete Streets," or safety.
2. Encourage public and private partnerships with the freight transport industry to develop mutually beneficial strategies and initiatives.
3. Encourage the use of rail for movement of freight and long distance passenger trips.
4. Support higher-speed and higher-frequency passenger rail service and use of the historic Eugene Depot in downtown Eugene as a passenger rail station.
5. Reduce conflicts between rail and street traffic.
6. Create a railroad quiet zone throughout the City. Prioritize implementation of a quiet zone in the downtown and Whiteaker areas.
7. Support projects and regulations that reduce transportation inefficiencies or risk to local populations from the transportation of hazardous materials.

Eugene Station

Source: City of Eugene

Potential Actions for Rail, Freight, and Pipeline Policies

A. Promote truck loading facilities at the train yard.

B. Monitor travel time reliability on state and federal freight routes and prioritize improvements to these corridors when chronic delays are projected to become a detriment to regional economic development strategies.

C. Improve the safety and efficiency of trucking through information technological means such as telematics, signing, urban freight information and maps.

D. Implement the Eugene Depot Master Plan.

E. Construct a passenger platform and rail spur at the Eugene Depot to enhance passenger rail service and separate passenger rail from freight rail.
F. Implement the recommendations of the Oregon Passenger Rail Study (pending at the time the *2035 TSP* was adopted).
G. Coordinate with rail providers to upgrade at-grade rail crossings to improve traffic safety and manage conflict points while maintaining access for non-rail travel where possible.
H. Install supplemental safety measures (SSMs), such as quad gates and medians, at railroad crossings, as necessary, starting in the downtown and Whiteaker areas, to implement a railroad quiet zone.
I. Support rail-related infrastructure improvements that help retain and improve passenger and freight rail services in Eugene.
J. Support projects that reduce the number of times materials are transferred between pipes, trains, planes or trucks.
K. Reduce environmental impacts and the risk of accidents involving trucking through infrastructure improvements, road design and layout, and promoting the use of environmentally-friendly vehicles.
L. Work with Lane County to investigate creating a railroad quiet zone that addresses the rail crossings of Irving Road and Irvington Drive.

Air Transportation Policy

1. Support the Eugene Airport as a regional transportation facility.
2. Recognize the *Eugene Airport Master Plan* as the guiding policy document for airport property development, services, and support infrastructure.

Potential Actions for Air Transportation Policy

A. Periodically review and update the *Airport Master Plan*.
B. Review and update land use designations and zoning, as needed, to support development recommended by the *Airport Master Plan*.
C. Promote freight transfer facilities at the airport.
D. Expand alternatives to private automobile trips for airport patrons.

Eugene Airport

Source: City of Eugene

Greenhouse Gas, Climate Change, and Natural Environment Policies

1. Support the use of more highly fuel efficient vehicles including electric, hydrogen fuel cell, and non-motorized vehicles.
2. Create a strategy that advances the goal of having an integrated transportation system that reduces fossil fuel consumption by 50 percent and reduces reliance on single-occupancy automobiles.

3. Prioritize capital projects and programs that will facilitate the achievement of the *2035 TSP's* pedestrian, bicycle and transit policies.
4. Continue work to identify possible transportation infrastructure improvements that will make walking, bicycling and the use of transit safe and highly convenient.
5. Protect, and enhance habitat in transportation projects where possible. Minimize and mitigate impacts of transportation projects when needed.
6. Provide leadership in regional and State coordination efforts that support Eugene's environmental policies.

Potential Actions for Greenhouse Gas, Climate Change, and Natural Environment Policies:

A. Support programs aimed at reducing reliance on single occupancy vehicle travel.
B. Enhance the tree canopy along streets.
C. Reduce stormwater pollution and minimize runoff from streets and multi-use paths in a manner prescribed by Eugene's *Comprehensive Stormwater Management Plan*.
D. Increase supply of charging stations for electric vehicles.
E. Support legislation that updates the State building code to require basic electric vehicle charging infrastructure in new development.
F. Provide priority parking and reduced parking fees for non-gasoline powered vehicles.
G. Create a program that encourages properties adjacent to streets and alleys to replace paved areas with usable open space, permeable surfaces, plantings, stormwater retention areas, and other amenities for the public benefit (*e.g.*, a "green alleys" program).
H. Provide stormwater facilities within street construction projects by incorporating low impact development and green infrastructure practices.
I. Identify City Code amendments that will facilitate the achievement of the *2035 TSP's* pedestrian, bicycle and transit policies.

Stormwater treatment can be an attractive part of the streetscape.

Source: CH2M

Cost Effectiveness and Finance Policies

1. Establish, improve, and maintain transportation facilities in ways that cost-effectively provide desired levels of service, consider facilities' lifecycle costs, and maintain the City's long-term financial sustainability. Favor transportation systems that move people and goods at lesser total life-cycle cost to the City and its residents.
2. Maintain transportation performance and improve safety by improving system efficiency and management before adding capacity for automobiles to the transportation system by using the

following priorities for developing the Eugene Capital Improvement Program (CIP) and Eugene projects in the Metropolitan Transportation Improvement Program (MTIP):

- Protect the existing system. The highest priority is to preserve or improve the functionality of the existing transportation system by means such as access management, transportation demand management, improved traffic operations, use of technologies, accommodating "active transportation" options not previously present, and keeping roads well maintained to avoid reconstruction.
- Improve the efficiency and safety of existing facilities. The second priority is to make minor improvements to existing streets, such as adding turning lanes at intersections, providing and enhancing pedestrian, bicycle and transit facilities, and extending or connecting streets pursuant to existing plans.
- Add capacity to the existing system. The third priority is to make major improvements to existing transportation facilities such as adding general purpose lanes and making alignment corrections to accommodate legal-sized vehicles.
- Add new facilities to the system. The lowest priority is to add new transportation facilities for motorized vehicles, such as new roadways. New streets that are needed and planned for connectivity are a higher priority, as noted in (b), above.

Implement higher priority measures first unless a lower priority measure is demonstrated to be more cost-effective or better supports safety, growth management, or other livability and economic considerations. Provide justification for using lower priority measures before higher priority measures.

3. In collaboration with ODOT and Lane County, develop criteria that trigger logical phased jurisdictional transfer of streets and highways.
4. Operate and maintain transportation facilities in a manner that reduces the need for more expensive future repair, to the extent practical and affordable. Consider the City's ability to fund both implementation and ongoing maintenance before initiating or requiring new transportation capital projects. Explore opportunities to upgrade all utilities during street reconstruction.

Potential Actions for Cost Effectiveness and Finance Policies

A. Seek new, stable sources for funding street renovation and ongoing maintenance, including landscaping and other amenities in the public rights-of-way.
B. Develop a mechanism for calculating life cycle costs, including maintenance costs, of transportation projects.
C. Discuss with the public the potential cost savings for household transportation choices, such as savings in health care, fuel and auto insurance, etc., for choosing not to drive for some trips.
D. Continue and expand efforts to quantify and explain the total life-cycle costs of transportation options.
E. Regularly adjust Systems Development Charges to remain fair, legal, and aligned with adopted goals and policies.

F. Update and maintain Transportation System Development Charges to support the construction of pedestrian, bicycle and transit facilities in addition to roadway projects that meet the above policies.
G. Approve memoranda of understanding (MOU) with Lane County and ODOT that establish the circumstances under which streets would be transferred to City jurisdiction.
H. Engage the community in exploring new potential funding sources for on-going pavement preservation needs.

Equity, Economy, and Community Engagement Policies

1. Be fair and equitable: ensure that transportation facilities are provided for people of all ages, races, ethnicities, abilities, incomes, and in all neighborhoods.
2. Reduce or eliminate disparities between neighborhoods in safety and access to essential destinations. Ensure that the costs and benefits of transportation improvements are equitably shared over time. Favor historically underserved communities if equitable solutions are not possible within a single project or action.
3. Build and maintain public support for the *2035 TSP* through open information, public participation, public discussion of the plan's effects on the community, and periodic reassessment of the plan's goals and policies.
4. Encourage local residents, businesses, City staff, and other stakeholders to cooperatively develop context sensitive projects that foster the community's active use and sense of ownership of public rights-of-way over time.
5. Use transportation investments to support industries and employment sectors targeted by City and regional adopted economic development strategies.

Potential Actions for Operational Policies

A. Identify and collaborate with potentially impacted populations during and after project scoping, with special attention to disadvantaged or traditionally underserved populations (*e.g.*, lower income, minority, English language learners, and people with disabilities).
B. Target public outreach before transportation spending priorities are established so that people who may be most affected by proposed projects will be involved in the discussion.
C. Create procedures that support parklets (*i.e.*, commercial uses, greenery, or seating in converted on-street parking spaces), bike corrals, intersection repair (*i.e.*, citizen-led conversion of an intersection into a public square), and similar projects that are responsive to the needs of neighborhood stakeholders.
D. Regularly consult with industry stakeholders to determine industry and employment transportation needs and trends. Update the *2035 TSP* project list, as appropriate, to reflect changing needs and trends.
E. Periodically review and collaboratively update as necessary the Regional Prosperity Economic Plan (or successor) and the *2035 TSP* to keep the two plans aligned.
F. Prioritize transportation investments that facilitate job growth in commercial or industrial areas.

Chapter 3: Needs Assessment and Evaluation

The *2035 TSP* goals, policies, projects, and potential implementing actions are based on analysis by, and input received from, the community, City of Eugene staff, partner agency staff, and City policy-makers. Their review included analysis of existing transportation conditions for all modes of travel, forecasted deficiencies in the transportation system, a multi-step evaluation of the "triple bottom line" (economy, social equity, and natural environment) that included considerations of how possible system improvements will meet the transportation needs for all modes, address the needs of the transportation disadvantaged, and address the need for movement of goods and services to support industrial and commercial development. The *2035 TSP* list of recommended projects and programs was identified based on an analysis of the City's transportation needs, potential transportation system alternatives, and a detailed review of relevant state, regional, and local plans, policies, and funding opportunities. The following sections outline the key findings from the existing and future needs analyses that helped shape the recommendations.

Existing Transportation System Conditions

Existing local transportation needs, opportunities, and constraints reflect an inventory of the multimodal transportation system characteristics conducted in 2010. This inventory included all major transportation-related facilities and services within the Urban Growth Boundary (UGB) at that time. Key roadway features, traffic conditions, safety performance, bicycle and pedestrian facilities, and transit service, among other topics, were analyzed. Detailed findings of the technical analysis are summarized in Volume 2, Appendix A: Existing conditions inventory and analysis. Key findings of this review are outlined below.

- Downtown Eugene and adjacent neighborhoods are well-served by sidewalks. In other areas of the City, sidewalks are frequently missing on one or both sides of the roadway. Some sidewalks are located adjacent to curbs on high traffic streets, without a buffer of landscaping or parked cars next to traffic, which can discourage walking. The citywide pedestrian system is also interrupted by a lack of street lighting, lack of pedestrian crossing treatments at some intersections, and long distances between protected crossings on busy streets. Walking can be improved by filling gaps in the sidewalk network, improving buffers from traffic, and providing improved crossings and other safety measures.
- A number of arterial roadway corridors and key intersections could benefit from strategic capital improvements to the existing system. These may include:
  - Better connectivity;
  - Improved safety measures, especially where walking and bicycling are introduced within the street rights-of-way; and

- Implementation of Transportation System Management and Operations (TSMO) strategies that increase the efficiency of the arterial system. TSMO strategies (more fully described in Appendix K in Volume 2) might include ramp meters along highways, coordinated and more responsive traffic signals, and educational programs that encourage travel without single-occupant automobiles and at less congested times of day.

Using technology to improve transportation

Transportation System Management and Operations (TSMO) strategies provide **money-saving, multi-modal solutions that relieve congestion, optimize infrastructure investments, promote travel options, and reduce greenhouse gas emissions.** They can include intelligent transportation system solutions such as traffic responsive signals, real-time traveler information, and services that respond quickly to traffic incidents or help people make informed travel choices.

- Eugene enjoys a substantial pedestrian-bicycle shared-use path system, especially parallel to the Willamette River and Amazon Creek. Although the pathway system is extensive, the existing needs are related to the width of pathways (the busier sections are too narrow to comfortably accommodate all of the users), lack of connections to some adjacent neighborhoods, and the lack of consistent and regular pathway lighting. There are also some locations where the lack of wayfinding signs and pathway markings provide challenges to some users unfamiliar with the path system.
- The City's on-street bikeway system is extensive. The existing deficiencies relate to:
  - Lack of connections between existing routes;
  - Lack of consistent pavement markings;
  - Need for better separation from motorized vehicular traffic;
  - Integration of bicycle movements into signal phases;
  - Additional street lighting;
  - Additional wayfinding signage; and
  - Poor quality of some existing street surfaces.

Basis of Needs Assessment

The following sections describe the assumptions used to develop the assessment of needs for the *2035 TSP*.

Planning Area and Land Use Assumptions

The *2035 TSP* addresses the projects, programs, and policies needed to support growth in population and jobs within the Eugene UGB as well as the travel associated with regional and state economic growth between now and the year 2035. The *2035 TSP* defines the transportation facilities needs within Eugene's adopted UGB, as defined in the *Mero Plan*, Eugene's adopted comprehensive plan. Over time, the City, Lane County, and ODOT will monitor the multimodal transportation needs and can update the *2035 TSP* to respond to changing conditions.

The *2035 TSP* also supports the land use strategies defined in *Envision Eugene, A Community Vision for 2032* (2012) and prioritizes recommendations that mitigate the strain on roadways by supporting transit service and making walking and bicycling trips more practical for working, shopping, and other daily

activities; managing congestion; and improving safety. One primary focus of both the *Metro Plan* and *Envision Eugene* is on more compact development. As such, significant future residential development is likely to occur in the Downtown and "Key Corridors" (see Volume 2, Appendix E), including:

- Willamette Street;
- W 11th Avenue;
- Highway 99;
- River Road;
- Coburg Road;
- Franklin Boulevard.

The *2035 TSP* includes projects and programs, and identifies financial resources, that support the growth anticipated over the next 20 years along these Key Corridors.

The needs assessment and resulting projects (set forth in Chapter 4) that establish a transportation system adequate to meet the identified local transportation needs are based upon the land use designations established by the *Metro Plan.* Because the *2035 TSP* is based on the *Metro Plan* land use designations, any zone allowed within the land use designation is consistent with both the *Metro Plan* and this *2035 TSP*.[7] The *2035 TSP* reflects Eugene policy makers' and community members' priority to maintain existing facilities and provide multiple transportation options for local and regional travel. These priorities are based on the premise that the City can reduce congestion, save money, and provide health benefits for the entire community by providing alternatives to single occupancy vehicle travel and by making existing streets safer and more efficient without costly increases to automobile-oriented infrastructure.

2035 Population and Employment Forecasts

Forecast of year 2035 traffic volumes informed the identification of future transportation needs. The 2035 traffic volumes reflect estimates of household and job growth within the adopted UGBs of Springfield, Eugene, and Coburg as well as in Lane County and the overall region. These population and employment forecasts were "coordinated" for compliance with Oregon transportation and land use planning requirements.

The Eugene UGB shown in Attachment A, Figure 1, was used as the basis for the 2035 land use forecasts. Table 1 shows household and job growth forecasts within this UGB. This growth was allocated to developable areas within the current UGB consistent with the land use designations shown in the adopted *Metro Plan*.

Table 3.1: City of Eugene Land Use Estimates

	Year 2010	Year 2035	Growth
Population Forecast	177,332	219,060	41,728 (23%)
Households	74,950	92,580	17,630 (23%)
Employees	80,900	114,460	33,560 (42%)

[7] Looking ahead, when the City adopts a new comprehensive plan, unless the new comprehensive plan changes the current *Metro Plan* land use designations, a zone allowed within the land use designation will be consistent with both the new comprehensive plan and this *2035 TSP.* If adoption of the new comprehensive plan includes an expansion of the UGB, any amendments to the *2035 TSP* that are necessary to address the expansion area will be adopted currently with the UGB amendment.

Traffic Volume Development

Based on the geographic allocations of future job and household growth within the UGB, Lane Council of Governments (LCOG) developed traffic volume forecasts for the City's collector and arterial street system using an "emme" travel demand model. This model is calibrated to traffic volumes measured on streets and highways within the City. In addition to land use and street network inputs, the model also relies on information about existing traveler behavior and trip-making characteristics derived from surveys, and from research that forecasts how people might use the transportation system in the future.

Based on information obtained from LCOG, coupled with measured traffic counts at 50 intersections within the City, year 2035 intersection and roadway volumes were analyzed using a procedure consistent with guidance from ODOT's Analysis and Procedures Manual (APM). This analysis provided one method of identifying future transportation needs within the City's UGB.

Baseline Analysis

Previously adopted City of Eugene plans, *TransPlan,* and the *Regional Transportation Plan* (*RTP*) all identified a variety of street, pedestrian, bicycle, and transit projects that could be implemented in the future. A Baseline Analysis (also known as a "no build alternative") was performed for the *2035 TSP* to help identify multimodal projects and programs needed to support growth through the year 2035. This analysis informs the development of the 2035 project list reflected in Chapter 4.

The Baseline Analysis assumes the 2035 population and employment forecast and that the existing street, pedestrian, bicycle, and transit system will not change by 2035 except for the construction of transportation improvements that have already been started or for which funding is already allocated. At the time the analysis was prepared, there were no guaranteed funding sources for any major projects that will materially affect traveler behaviors and traffic volumes on the City's street network in the future, with the exception of the extension of EmX transit service to west Eugene.

With this baseline estimate of future travel conditions founded on the current transportation system, different transportation improvement strategies under consideration could be compared to each other and to the baseline. In this way the *2035 TSP* project list was constructed anew by reassessing unbuilt projects contained in previous plans and comparing these to new ideas for meeting our transportation needs.

Identified Transportation Needs

The results of the year 2035 Baseline Analyses are summarized in Volume 2, Appendix B: No Build analysis. Per this analysis, key corridors that could experience vehicular congestion and long queues at traffic signals include:

- The W 11th Avenue corridor from the UGB into downtown (even with the implementation of the EmX project).
- The Highway 99 corridor, particularly south of the Randy Papé Beltline and towards downtown.
- The River Road/Chambers Street corridor within the vicinity of the Randy Papé Beltline and south of the Northwest Expressway. River Road at Randy Papé Beltline Highway is a critical link in the regional and emergency response network since, without it, there would be 2.5 miles between other grade-separated crossings.

- The 6th Avenue/7th Avenue corridor, west of I-105, which provides a key vehicular and freight connections from points west of downtown to the Ferry Street Bridge and Coburg Road.
- Franklin Boulevard corridor between I-5 and downtown.
- Randy Papé Beltline Highway between Coburg Road and River Road. ODOT, Lane County, and the City of Eugene will participate in a project to identify future solutions for this segment of the corridor. *2035 TSP* will be updated to reflect these ongoing efforts, as appropriate.
- Randy Papé Beltline Highway between Roosevelt Boulevard and W 11th Avenue.
- Coburg Road between downtown and the bridge over the McKenzie River near I-5.
- The East 30th Avenue/Amazon Parkway corridor between E 18th and 27th Avenues and between Hilyard and Agate Streets.
- All four Willamette River motor vehicle bridge crossings.

In addition to the roadway needs identified by the traffic model and by the analysis of existing transportation system conditions, the Transportation Community Resource Group (TCRG), participants at community workshops, Technical Advisory Committee (TAC), and agency staff identified these following needs to be addressed by the TSP:

- Improved range of transportation choices, especially for the transportation disadvantaged and connections between residents and employment.
- Improved safety for all travelers.
- Reliable freight movement, which is important to the national, state, and local economy, especially on designated freight routes.
- From the *2012 Bicycle and Pedestrian Master Plan*: filling gaps in the sidewalk system, gaps in the designated bikeway system, and need for improved pedestrian and bicycle facilities that will encourage greater use.

A word about "capacity"

One way to measure the performance of the transportation system is to compare the demand for travel on the system with the system's capacity to accommodate that demand. The demand for travel comes in many different forms, including motorized vehicles (autos, trucks), transit riders, and pedestrians and bicycles. The capacity of the system to accommodate these different forms of travel is expressed in similar terms.

Another way to measure the performance of the transportation system is to assess how well it is performing from a traveler's perspective. This is referred to as the quality of service or "level of service" (LOS) that is provided and it is typically summarized in a scale from A (representing the best quality of service) to F (representing the worst quality of service). A variety of factors affect the quality of service traveler's experience, and each of the different forms of travel is affected by different factors.

As an example, the quality of service for a bicyclist can be influenced by the volume and speed of vehicular traffic, the number of heavy vehicles, the potential for conflicts with pedestrians, and the pavement condition. On the other hand, the quality of service for vehicles is influenced by the delay experienced at intersections and the speed of travel along a roadway.

- From the *Long Range Transit Plan* and *Envision Eugene, A Community Vision for 2032 (*2012): a need for frequent, reliable transit services along Key Corridors.
- From the *Climate and Energy Action Plan* and Climate Recovery Ordinance: a desire to reduce community-wide greenhouse gas emissions 10 percent below 1990 levels by 2020, reduce community-wide fossil fuel use 50 percent by 2030, and adapt to a changing climate and increasing fossil fuel prices.
- Equitable distribution of improvements geographically and for economical and other social strata.

Evaluation of Transportation System Alternatives to Address Identified Needs

The Transportation Community Resource Group (TCRG), participants at community workshops, Technical Advisory Committee (TAC), and agency staff identified a number of transportation system alternatives that had the potential to address existing and future transportation needs. These alternatives address all modes of travel and also include programs that would reduce vehicular travel demand. Further, these potential system alternatives avoid principal reliance on any one mode of transportation and increase transportation choices, and reflect Eugene's commitment to the sustainability triple bottom line (environment, equity, and economy). City staff developed these ideas into a potential project list that was screened by the TCRG and Project Management Team (PMT) against a set of evaluation criteria established by the TCRG. This multistep process is described below.

Evaluation Framework

Early in the TSP process, the PMT, TCRG, and TAC developed an evaluation framework for screening potential projects. This framework referenced the Sustainable Transportation Analysis and Rating System (STARS)[8] and is reflective of the City's commitment to the Triple Bottom Line. Table 3.2 presents the evaluation criteria applied to the potential project list. Some criteria, noted as "key criteria," proved most useful and effective in comparing project and program ideas. While the "key criteria" often served as differentiators between potential projects, all criteria listed below were used to perform a preliminary screen of potential projects that address existing and future needs. All of the criteria were also used for a more detailed review of those ultimately identified for the 20 year list of projects reflected in Chapter 5.

[8] www.transportationcouncil.org

Table 3.2: Evaluation Criteria

Evaluation Criteria	Key criteria
1. Safety and Health	
Double the percentage of pedestrian, bicycle, and transit trips by the year 2035.	
Improve community health by increasing physical activity as part of the transportation system.	
Support the reduction in quantities of harmful airborne pollutants associated with transportation.	
Improve safety and security for all users, especially for the most vulnerable; strive for zero fatalities.	x
2. Social Equity	
Use future transportation investments to reduce or eliminate disparities between neighborhoods in access, economic benefits, safety, and health.	x
3. Access and Mobility for All Modes	
Foster neighborhoods where 90 percent of Eugene residents can meet most daily needs without relying heavily on an automobile.	x
Improve the comfort and convenience of travel, especially for walking, bicycling, carpooling, and riding transit.	
Maintain a network of Emergency Response Streets to facilitate prompt emergency response.	
Complete safe, comfortable, and direct sidewalk and bikeway networks between key destinations, transit stops, and residential areas.	
Support Lane Transit District's efforts to provide high-capacity, frequent transit service, on the Frequent Transit Network.	
4. Community Context	
Ensure consistency between transportation investments and all relevant adopted and accepted local plans.	
5. Economic Benefit	
Support redevelopment priorities by promoting compatible transportation investments along key corridors and in core commercial areas, including downtown.	x
Encourage infrastructure and programs that allow residents to reduce expenditures on fuel and vehicle use.	
Support predictable travel times between key origins and destinations for high priority trips such as transit and regional freight movement.	
Increase access to employment centers via foot, bike, and transit, while improving the quality of the traveling experience.	x
Support access and visibility of businesses that rely on drive-by traffic by balancing congestion with economic development goals.	
6. Cost Effectiveness	
Optimize benefits relative to public, private, and social costs over the plan's time horizon.	x
Maximize the efficiency and life of the current transportation system.	
Favor transportation investments that have potential funding for both implementation and ongoing maintenance.	

Evaluation Criteria	Key criteria
7. Climate and Energy	
Focus on transportation programs and projects that help to: • reduce total community-wide fossil fuel use by 50% by 2030 • reduce vehicle miles traveled per capita by 10% by the year 2020 • reduce community-wide greenhouse gas emissions 10% below 1990 levels by 2020	x
8. Ecological Function	
Improve water quality and lower the rate of stormwater runoff from transportation infrastructure.	
Reduce the urban heat island caused by paving that absorbs and re-radiates heat.	
Foster transportation investments that avoid damaging and improve habitat areas, where possible.	x

Initially, the potential project ideas identified to serve existing and future multimodal needs were presented to the TCRG, PMT, and TAC as conceptual "fat lines" on maps to denote areas of concern. These maps grouped potential ideas by geographic areas of the City to ensure that every neighborhood's needs were addressed.

Based on feedback on the conceptual idea maps, the PMT culled the list of potential project ideas against the following questions:

1. Does the project address an identified transportation problem or opportunity?
2. Is the project within the City of Eugene's Urban Growth Boundary or planning area? Is it within the City's control, or the control of its partnering agencies, to implement?
3. Is it technically feasible to build this project?
4. Could the project be funded?
5. Could the project receive necessary environmental permits?

If the answer to any question was "no," the project idea was not considered further. Those remaining ideas were identified as projects and evaluated by City staff against the criteria shown in Table 3.2. The staff evaluation was then presented to the PMT and TCRG for further review.

The TCRG and PMT reviewed and refined this evaluation to define a 20-year project list that could address the identified transportation needs, and meet the draft *2035 TSP* goals and criteria contained on ORS 660-012-0035. In addition, City staff, working with the PMT, TCRG, and public input, identified additional projects that would be needed to support a specific residential or employment development area, those that would require more study prior to being added to the 20-year list, and those that were not needed to support the identified needs but could be considered if changes occurred in the future. City staff also identified operational projects, such as intersection modifications and signal system improvements that are critical to the successful implementation of City transportation goals and policies.

The screened projects were advanced for inclusion in this TSP as the "20-year list," "Study Projects", "Projects to Complete Upon Development", and "Operational Projects", respectively. The PMT performed a qualitative and quantitative evaluation of these projects relying on the key criteria shown in Table 3.2. The draft project lists and a map of the project locations were posted to the project's public website for three years prior to adoption. The project lists are provided in Chapter 5.

Chapter 4: Creating Multimodal Systems

The *2035 TSP* is fundamentally a set of policies, programs, and projects that address the transportation needs within Eugene's UGB over the next 20 years with a coordinated multimodal transportation system. This chapter provides an overview of these programs and projects. Policies and potential programs are provided in Chapter 2, whereas the detailed project list is shown in Chapter 5. Planning for a network of "Complete Streets" that can serve the City's identified transportation needs is an integral part of the *2035 TSP.* Although automobiles will continue to be a primary mode of travel, and preservation and improvement of the existing street system remains important, the *2035 TSP*'s projects, policies, and programs highlight improvements that are designed to increase transportation choices, reduce reliance on the automobile by better accommodating and encouraging travel by foot and bike for short trips, improve safety for all street users, and provide for more reliable transit service on Key Corridors. It is this focus of the *2035 TSP*, together with the City's adopted land use plans and regulations, that will ultimately result in land use patterns and transportation systems that make walking, cycling, and use of transit highly convenient so that, on balance, people need to and are likely to drive less than they do today.

It is a goal of this plan to triple the percentage of trips made on foot, by bicycle, and by transit from 2014 levels. Through a combination of transportation system improvements and land use measures, walking and biking could become the preferred methods of travel for trips under 0.5 miles and 2 miles, respectively.

Achieving Complete Streets

Achieving a network of "Complete Streets" and helping more Eugene residents and visitors **shift their travel towards walking, bicycling, and transit** will provide many benefits to individuals and the community at large, including:

- Reduced traffic congestion and exposure to crashes and injury;
- Higher levels of individual health and wellness;
- Healthy business districts and more dollars staying in the local economy;
- Better air quality and lower levels of greenhouse gases and noxious emissions;
- Available options for lower cost travel;
- Lower costs for roadway maintenance;
- More equitable access to community resources; and
- More options for all people, and especially youth and seniors, to travel independently throughout the community.

Pedestrian System

The *2035 TSP's* pedestrian-oriented projects and programs are aimed at serving different types of walking trips for people of all ages and abilities. To ensure that walking will constitute most of the trips of less than half a mile within Eugene, pedestrians must feel safe and comfortable, and have convenient access to their desired destinations. The pedestrian capital projects and operational programs in the *2035 TSP* focus on components of transportation system alternatives that address the following needs identified through analysis of the existing and future system deficiencies:

- Filling gaps in the sidewalk network between neighborhoods, schools, parks, recreational areas, activity centers, and major transit stops, and to regional facilities;
- Arterial and collector street crossings and safety enhancements;
- Widening the shared use pathway system in the busiest sections; and
- Education about walking safety and access to key routes.

The *2035 TSP* also calls for an update in the City's street design standards, development of a sidewalk infill program, and improved enforcement of laws that improve pedestrian safety.

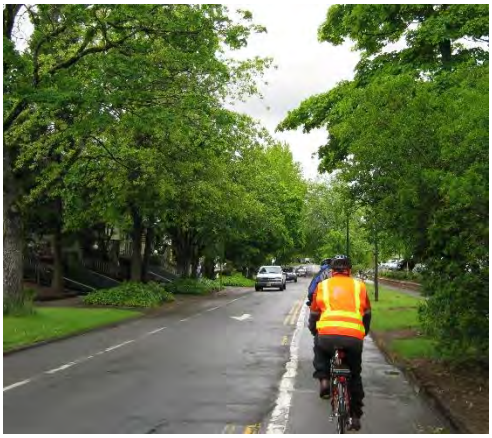
The City has updated its *2015 Americans with Disabilities Act Transition Plan for Accessibility in Public Rights-of-Way*[9] to better identify existing transportation facility deficiencies, such as curb ramps and accessible pedestrian devices, and develop a phased plan to eliminate these deficiencies.

The list of pedestrian projects in support of the policies and the identified needs are shown in Chapter 5. These were largely pulled from a 2012 pedestrian and bicycle master planning effort. Appendix F of Volume 2 provides the outcome of that March 2012 Pedestrian and Bicycle Master Plan. While the map of all potential pedestrian system improvements include some on local streets, only improvements on collector and arterial streets were considered for the *2035 TSP* project list and cost estimations.

Bicycle System

To encourage increased travel by bicycle, the *2035 TSP* provides a list of projects and programs that will improve safety, convenience, and direct connections for people traveling by bike. Bicycling promotes the health of individuals, has a low impact on the environment, and allows people to move independently throughout the community without motorized vehicles, including many who cannot or choose not to drive. The bicycle-oriented capital projects and operational programs in the *2035 TSP* focus on components of transportation system alternatives that address the following needs identified through the analysis of existing and future system deficiencies:

- Completing the bicycle route network throughout the City;
- Street designs that slow speeds on neighborhood greenways;
- Increasing the quantity of bike lanes that are separated or buffered from motorized traffic or parked cars;
- A convenient bike share system;
- Better wayfinding signage;
- Educational programs;



Separate bike facilities can be useful in busy locations.

Source: CH2M

[9] In 2015, the City of Eugene conducted an evaluation of its public rights-of-way, and developed a transition plan that outlines in detail how the city will ensure safe access to all of its facilities for all individuals. As part of this new draft companion transition plan, Public Works collected detailed data on over 15,000 sidewalk ramps and 250 pedestrian signals to develop transition schedules specific to these facilities. In addition to the inventory of ramps and pedestrian signals and schedules, the transition plan for the public rights of way also includes a system of barrier removal prioritization, information on how to request barrier removals from right-of-way facilities, and an appeals process.

- Expanded bike storage on buses and at transit stops and stations; and
- Improved bicycle connections to transit hubs.

The list of bicycle projects in support of the policies and the identified needs are shown in Chapter 5. The *2035 TSP* is the City's bicycle and pedestrian plan, providing projects and policies that will create a network of bicycle and pedestrian-friendly routes throughout the planning area. The identified bicycle needs, as well as the bicycle policies and projects set forth in the *2035 TSP*, were largely pulled from a March 2012 pedestrian and bicycle master planning effort, the outcomes of which are provided in Appendix F of Volume 2. While the map of all potential bicycle system improvements may include some on local streets, only improvements on collector and arterial streets were considered for the *2035 TSP* project list and cost estimates.

Transit System

The City's comprehensive land use plan and *Envision Eugene, A Community Vision for 2032* vision articulated in 2012, rely on frequent, reliable transit service to serve major streets, known as "Key Corridors," where higher density and mixed-use development is encouraged. The *2035 TSP* policies promote improved transit services that are integrated through context specific multimodal planning for all Key Corridors. The provision of high-quality, available, and reliable transit service fundamentally supports the environment, economic development, and equity for all travelers.

Based on the needs analysis, the *2035 TSP* focuses on collaboration with LTD to provide service enhancements, capital improvements, and policies that support:

- Changes to streets and intersections to facilitate bus movement;
- Frequent and reliable transit service, including bus rapid transit (*e.g.*, "EmX"-style of transit service) along Key Corridors;
- Amenities that also serve pedestrians and people on bikes, and intermodal connections to transit;
- Car share and bike share programs that can extend the first and last mile of transit trips; and
- Refinements to transit routes and schedules.

The *2035 TSP* supports Lane Transit District's Frequent Transit Network (FTN), as defined in the Lane Transit District *Long Range Transit Plan*, as a regional initiative to better connect areas of more active development to transit.

The list of transit projects in support of the policies and the identified needs are shown in Chapter 5. Appendix J of Volume 2 of the *2035 TSP* provides LTD's Long Range Transit Plan from which the TSP's transit-related needs, policies, and projects were in large part identified.

Street-related Projects and Programs

The needs analysis identified arterial and collector streets that experience or are projected to experience traffic congestion and delay, lack of pedestrian and bicycle facilities that comfortably serve a broad range of prospective users, and conditions that hinder implementation of frequent, reliable transit services in a cost effective manner. The following corridors were identified as strategic areas of focus: West 11th Avenue, Highway 99, River Road/Chambers Street, 6th and 7th Avenues, Franklin Boulevard, Randy Papé Beltline, Coburg Road, East 30th Avenue/Amazon Parkway, and each of the

Willamette River bridges. In addition, the following streets are also defined as Key Corridors by *Envision Eugene, A Community Vision for 2032,* articulated in 2012, where higher density and mixed-use development is encouraged: Willamette Street, West 11th Avenue, Highway 99, River Road, Coburg Road, and Franklin Boulevard.

To meet the identified street system needs, the *2035 TSP* focuses strategies that improve connections between existing neighborhoods, employment, and commercial areas; provide connections to newly developed areas; improve safety for all travelers, and increase the use of Transportation Demand Management (TDM) and Transportation System Management and Operations (TSMO) programs that increase the efficiency of the existing system. The policies and potential actions contained in Chapter 2 promote the preparation of comprehensive multimodal and land use plans for each Key Corridor, which will help identify context-appropriate design solutions and a prioritized list of improvements for each corridor.

The list of street-related projects and programs are provided in Chapter 5. Appendices B and D of Volume 2 detail the existing and future needs and deficiencies from which these projects, policies, and programs are based.

Functional Classification of Streets

Most of the City is served by an established network of streets. It is expected that automobiles will continue to be the primary method of personal travel for the next 20 years. The street system is also important for the conveyance of freight, public transit, and for emergency responses. The *2035 TSP* focuses on projects that improve safety and increase the efficiency of the existing street system as well as the provision of new streets to serve newly developing areas within the UGB.

The City of Eugene street functional classification system organizes the roadway network as a balanced hierarchy of mobility and access to, through and between different types of land uses. Some factors that are considered in setting a roadway's functional classification are average daily traffic (ADT) volumes, street connectivity, spacing of streets, the mix and amounts of different travel modes on a typical segment (*e.g.*, bikes and cars), etc. Over time, as the community continues to grow and mature, functional classifications are periodically revisited to insure that particular street classifications are still appropriate.

Functional classifications are defined below.

- **Major arterials** continue through cities and towns, and become the primary "arteries" for intra-urban movement within larger cities, as well as providing for through traffic and for travel from the city to outside destinations. One of the key characteristics of urban major arterials is therefore the high degree of connectivity they provide within cities. These streets and highways typically connect various parts of the region with one another and with the "outside world" beyond the city, and serve as major access routes to regional destinations such as downtowns, universities, airports, regional shopping centers, and similar major focal points within the urban area. In Eugene, major arterials typically have four or more vehicular travel lanes and, with the exception of freeways and expressways, typically have (or are designed to have in the future) sidewalks and planting strips, striped bicycle lanes, and raised median islands or two-way left turn lanes.
- **Minor arterials** function as conduits for a large proportion of intra-urban trips. These streets provide the next level of urban connectivity below major arterials. Minor arterials sometimes provide a fairly high degree of intraregional connectivity. In Eugene, a typical minor arterial contains two vehicular

lanes plus a center turn lane, bike lanes, planting strips (in some cases), and sidewalks. A few minor arterials are wider and contain up to 4 vehicular travel lanes plus left-turn lanes or median islands.

- **Collector streets** connect vehicles, pedestrians, and bikes from the interior of a neighborhood or employment area and deliver it to the nearest arterial street. Collectors are also designed to provide access to properties. They usually serve shorter trip lengths and have lower traffic volumes than arterial streets. Collector streets are important emergency response routes and are frequently transit routes. While the function of major and neighborhood collectors is essentially the same, the neighborhood collector classification is applied only in residential neighborhoods and on rural streets. Standards for neighborhood collectors provide additional design flexibility to preserve the livability and character of residential areas.

  - **Major collectors** can be found in residential, commercial and industrial areas. Typically, major collectors have greater right-of-way and paving widths, and wider traffic lanes than neighborhood collectors. Major collectors frequently have continuous left turn lanes and normally include sidewalks, planting strips, and striped bike lanes whereas provision for on-street parking varies by location. Major collectors may be designed with raised medians to reduce conflicts, provide a pedestrian refuge, restrict turning movements, limit land access, or to furnish an aesthetic separation between traffic lanes.

  - **Neighborhood collectors** are found only in residential neighborhoods and provide a high degree of access to individual properties. This street type does not apply to commercial and industrial areas, or to most areas with a concentration of multifamily residential buildings. As a rule, both right-of-way and paving widths are narrower than for major collectors. Left turn lanes are infrequently used on neighborhood collectors, and then only at intersections with higher volume streets. Neighborhood collector design provides for a great deal of flexibility for on-street parking. On most neighborhood collectors, bicycles share the travel lane with motor vehicles, eliminating the need for striped bicycle lanes. Exceptions to this can occur in situations where traffic volumes or speeds, roadway geometry, or other factors suggest that striped lanes will provide a safer design.

As part of the needs analysis, *Eugene's Street Classification Map* was reviewed in light of the classifications shown in the *Regional Transportation Plan* (*RTP*), the *Oregon Highway Plan* (OHP), and the criteria set forth in the *Eugene Arterial and Collector Street Plan* (*ACSP*). This review identified a number of streets that needed a change in classification to ensure consistency between the various plans governing and providing guidance to the operation and construction of streets and roads within the City's UGB. All streets within the UGB need to be classified under the City's criteria. Attachment B is the 2016 Street Classification Map that updates the street classification map adopted by the City Council in 1999.

Street Design Standards

Street design standards provide information on how streets within each of the functional classifications "look and feel." The City's adopted *Design Standards and Guidelines For Eugene Streets, Sidewalks, Bikeways and Accessways* (1999) set forth how existing streets can be modified and new streets can be constructed to accommodate the needs of people with disabilities, riding bicycles, using transit, walking, driving automobiles and moving freight. See Appendix H in Volume 2 for further details on the design standards.

In the past, most street design standards were primarily oriented toward moving vehicular traffic, providing rudimentary bike lanes and sidewalks for pedestrians. The *1999 Design Standards and Guidelines for Eugene Street, Sidewalks, Bikeways and Accessways* serves as the City's current mandatory design standards and advisory guidelines for arterial, collector, and local streets, and provide for safe and convenient bike and pedestrian circulation. These *Design Standards and Guidelines* will need to be updated to incorporate the *2035 TSP's* newer guidance on best practices for bicycle and pedestrian facilities. The policies and action items in *2035 TSP* provide guidance for future updates to street standards. For example, application of the *2035 TSP's* Complete Streets policy will advance the provision of streets that are designed and constructed to provide comprehensive and integrated transportation networks that serve all modes of transportation and create quality facilities that invite people of all ages and abilities to pursue active transportation. It is through the provision of these comprehensive and integrated networks that the City will make walking, bicycling and use of transit highly convenient for those who choose not to drive as well as serving the needs of the transportation disadvantaged.

Bicycle and Pedestrian Facility Types

The following bicycle and pedestrian facility types are used in the City of Eugene.

Sidewalks	
	Sidewalks are paved walkways adjacent to roadways. Sidewalks are particularly important for basic mobility of people with disabilities. Setback sidewalks (featuring a planted barrier between the sidewalk and travel way) can create more comfort and safety for people walking.
Accessways	
	An accessway is a connector that provides a direct route between residential areas, retail and office areas, institutional facilities, industrial parks, transit streets, and neighborhood activity centers. An accessway will often provide connection between a shared use path and adjacent neighborhood streets.

Neighborhood Greenway	
	A neighborhood greenway is a bike route on a low-volume, low-speed street that has been optimized for bicycle travel. Neighborhood greenways contain different features depending on adjacent land uses, however all neighborhood greenways in Eugene will contain wayfinding signs, pavement markings, and intersection treatments. Neighborhood greenways may also feature diversion to reduce automobile volumes and traffic calming to slow motor vehicle speeds.
Shared Use Paths	
	Shared-use paths are paved paths separate from the roadway network that are designed for both walking and bicycling. Where space allows, high use corridors may be developed with redundant paths to separate people walking from people biking. The paths for people walking or running may be unpaved depending on intended use.
Sidewalk Paths	
	A sidewalk path, sometimes called a “sidepath”, is a separated facility for walking and bicycling adjacent to a roadway. Sidewalk paths most closely resemble a wide sidewalk. Due to user conflicts at intersections this type of facility is used sparingly in locations with few driveway entrances. Sidewalk paths are primarily used to connect segments of the bicycle network.
Bike Lane	
	A bike lane is a marked space along a length of roadway that is designated for use by people bicycling. Wheelchair users and some motorized scooters are allowed in bike lanes. Some bike lanes will feature a buffer strip to provide space between the bike lane and the auto lane or parked cars. Bike lanes may also use green colorant where an auto lane crosses the bike lane.

Protected Bike Lane	
	A protected bike lane, sometimes called a "cycle track", is an exclusive bicycle facility adjacent to, but separated from, the roadway. Separation is generally achieved using planters, parked cars, curbs, or posts to separate people biking from people driving. They are best on roads with few cross streets and driveways, particularly on roadways with high auto volumes and speeds. A protected bike lane provides a logical extension of a shared use path because it provides the sensation of riding on a path due to the separation from motorized traffic.
Grade Separated Crossings	
	A grade separated crossing occurs where an at-grade crossing is unsafe, such as crossing an interstate highway, or not practical. Grade separation in an urban context generally means that a facility for walking or bicycling is constructed below or above and existing roadway. Bridges across waterways are also considered grade separated crossings in Eugene.

Vehicular Performance Measurement

The City uses motor vehicle level of service (LOS) standards to evaluate acceptable vehicular performance on the City's local, collector and arterial streets. LOS standards are presented as grades A (free flow traffic conditions) to F (congested traffic conditions). ODOT uses mobility targets based on volume to capacity (V/C) ratios to evaluate acceptable vehicular performance on state facilities. As V/C ratios approach 1.0, traffic congestion increases.

These standards and targets are used to:

- Identify vehicular capacity deficiencies on the roadway system;
- Evaluate the effects of amendments to transportation plans, acknowledged comprehensive plans and land-use regulations pursuant to the Transportation Planning Rule (TPR; Oregon Administrative Rules [OAR] 660-12-0060) on the city and state roadways;
- Evaluate the traffic impacts of development applications for consistency with the land-use regulations.

In some cases, it may not be possible or desirable to meet the designated mobility target or LOS standard. In those cases, an alternative mix of strategies such as land use, transportation demand management, safety improvements or increased use of active modes may be applied.

The use of mobility standards for roadways identifies the maximum amount of congestion that an agency has deemed to be acceptable. Such standards are commonly used to assess the impacts of proposed land use actions on vehicular operating conditions and are one measure staff uses to determine transportation improvement needs for project planning. Mobility standards are typically expressed as Volume-to-Capacity (V/C) Ratios and/or Level of Service (LOS), which are defined below.

- **V/C** represents a facility's level of saturation (i.e., what proportion of capacity is being used), with values ranging from 0.01 to 1.00. A lower ratio indicates smooth vehicular operations and minimal delays. As the ratio approaches 1.00, congestion and vehicular delays increase. At a ratio of 1.00, the intersection, travel lane, or automotive movement is saturated resulting in longer queues and delays.

- **LOS** is a performance measure that is similar to a "report card" rating based on average vehicle delay. LOS A, B, and C indicate conditions where traffic moves without significant delays. LOS D and E indicate progressively worse operating conditions and more delay. LOS F represents conditions where average vehicle delay has become excessive and demand is near capacity. This condition is typically evident by long queues and delays, with intersection delays that may be difficult to measure because congestion may extend into and be affected by adjacent intersections. The table shows the average delay value (in seconds) corresponding to each LOS designation.

LOS	Signalized Intersections	Unsignalized Intersections
A	≤10 sec	≤10 sec
B	10–20 sec	10–15 sec
C	20–35 sec	15–25 sec
D	35–55 sec	25–35 sec
E	55–80 sec	35–50 sec
F	>80 sec	>50 sec

Table 4.1 presents mobility targets and LOS standards to be applied in the City of Eugene. Because mobility targets from the Oregon Highway Plan (OHP) are applied on state facilities, the City will seek ODOT amendment of the OHP to include alternative mobility on the identified ODOT facilities. ODOT performance standards are reflected in Table 4.1 for city streets near highway interchanges; this interchange influence area is generally defined as one-quarter mile from a ramp terminal or as the area between the ramp terminal and the first public street intersection.

Table 4.1: City of Eugene Vehicular Performance Measures

Jurisdiction	Roadway	Standard (peak hour, unless noted)
City	Citywide (unless otherwise specified)	LOS E
City	Eugene Downtown Traffic Impact Analysis Exempt Area	LOS F
ODOT	Randy Papé Beltline/Highway 99 ramp termini	1.0 V/C
ODOT	Randy Papé Beltline/Roosevelt Boulevard intersection	1.0 V/C
ODOT	Highway 99/Roosevelt Boulevard intersection	1.0 V/C
ODOT	Highway 99 from Roosevelt Boulevard to 5th Avenue; 6th and 7th Avenues to Garfield Street	1.0 V/C
ODOT	6th Avenue/Garfield Street intersection	1.0 V/C
ODOT	6th Avenue/Madison Street intersection	1.0 V/C

Jurisdiction	Roadway	Standard (peak hour, unless noted)
ODOT	6th Avenue/Chambers Street intersection	1.0 V/C (2 hour)
ODOT	7th Avenue/Chambers Street intersection	1.0 V/C
ODOT	6th and 7th Avenues from Madison Street to Lincoln Street	1.0 V/C
ODOT	Randy Papé Beltline/W 11th Avenue intersection	1.0 V/C (2 hour)
ODOT	River Road from Irving Road to River Avenue (Randy Papé Beltline Highway interchange influence area)	1.0 V/C
ODOT	Delta Highway from Green Acres Road to Goodpasture Island Road	1.0 V/C
ODOT	Coburg Road from Chad Drive to Elysium Avenue (Randy Papé Beltline Highway interchange influence area)	1.0 V/C
ODOT	Franklin Boulevard from Walnut Street to I-5	1.0 V/C

Some of the intersection and corridor locations listed in Table 4.1 are part of ODOT's Beltline Facility Plan and the related National Environmental Policy Act (NEPA) project. At the time the *2035 TSP* was drafted, the Facility Plan was complete but the NEPA project had not commenced. The recommended target threshold for the affected intersections/corridors will be refined to reflect NEPA findings. The *2035 TSP* recognizes the need to coordinate with these efforts and will be updated accordingly.

Truck Routes

Both the *2035 TSP* and the *Oregon Transportation Plan* (OTP, 2006) recognize the important role that an efficient and reliable transportation system plays in supporting the region's economy, growth, and quality of life. Within the Eugene-Springfield area, highways, city streets, airports, pipelines, and railways provide freight mobility. Trucks, rail, and air service must function together to ensure the efficient and timely movement of freight to, within, and through the community.

Discussions with the TCRG, TAC, Lane Area Commission on Transportation (Lane ACT), and other public stakeholders, identified a concern that freight movement would be hindered by delays in traffic congestion.

As part of the needs analysis, changes to the existing freight and truck routes were identified to ensure consistency with state and federal designations and guidance. One way in which this need is being address is an amendment to the Street Classification Map to change the classification of the Northwest Expressway (from the northern UGB to River Road) from a Minor Arterial to a Major Arterial. The *2035 TSP* policies support technological and information systems that will make freight delivery times more reliable.

A map of the state highway freight system from the 1999 Oregon Highway Plan is provided as Attachment E, Figure 1, State Highway Freight System.

Transportation System Management and Operations (TSMO) and Transportation Demand Management (TDM)

The *2035 TSP* Goals and Policies rely on providing cost effective, multimodal solutions that increase the safety and efficiency of the existing street system, promote travel options for all users, support the economy, and support the Climate Recovery Ordinance. Transportation System Management and Operations (TSMO) and Transportation Demand Management (TDM) strategies are a key part of achieving these goals.

Transportation Demand Management (TDM) are strategies and policies to reduce travel demand (specifically that of private single-occupancy vehicles), or to redistribute this demand in space or in time.

TSMO and TDM strategies enhance people's choices to bike, walk, take transit, share rides, and telecommute. Expansion of these strategies provides individuals with flexible options regarding how, when, where, and how often they travel. TSMO and TDM strategies do not encourage one mode of travel over another, but rather offer greater travel choices to enhance mobility and accessibility and to maximize transportation investments. Appendix K in Volume 2 contains a range of potential TSMO strategies that could be used by the City in the future.

TDM and TSMO strategies encompass commute and school-based trips, as well as casual trips to the grocery store, shopping mall, recreational sites, and special events.

In 2005, the City adopted *Standards for Transportation Demand Management Programs*. These standards provide a mechanism to vary the number of required off-street parking spaces by providing a strategy for reducing vehicle use and parking demand and using benchmarks to measure program effectiveness. The *2035 TSP* proposes to expand the use of TDM and TSMO practices beyond parking to help address traffic congestion, fossil fuel reduction goals, safety, and the financial burden of travel on individuals.

Eugene, in collaboration with the Central Lane MPO, LTD/ Point2point, and the City of Springfield identified the following key programs and services through the *Regional Transportation Options Plan*:

- Traveler Information and Coordination Tools: Continued outreach and education, "Sunday Streets," transportation fairs, community wide commute challenges etc.;
- Smart*Trips* individualized marketing programs to encourage active transportation choices;
- School-Based Transportation Options: Build off existing Safe Routes to School programs to include coordinated program with ridesharing and transit promotion. Expand program to middle and high schools;
- Rideshare (carpooling and vanpooling);
- Transportation Options Resource Program: Transportation Options Development Workshops and Training;
- Mobility Hubs: provide Wi-Fi technologies, pocket maps/brochures, secure bicycle parking, car- and bike-share services, shuttle service, and other assistance near several transit stations;
- LTD's Group Bus Pass program.

In addition to supporting these programs, the *2035 TSP* recommends intersection and corridor-based improvements that improve the efficiency of the existing traffic signal system (Intelligent Transportation

Systems, or ITS) and improvements to travel efficiencies, safety, and reliability with coordinated and responsive signal timing, bus and freight priority treatments, ramp metering, incident management, traffic monitoring, improved street lighting, and other safety-based measures.

Further details of TSMO and TDM strategies that support the *2035 TSP* are provided in the *Regional Transportation Options Plan* in Appendix G of Volume 2 and in the City's *Standards for Transportation Demand Management Programs*.

Parking

For people traveling by bike and by car, parking is an essential feature needed at the beginning and end of each trip. While the presence of adequate parking is an important factor in ensuring a city's economic vitality, especially in the downtown, retail and employment areas, surface parking lots are typically associated with significant areas of impervious surfaces dedicated solely for car storage and maneuvering room. The use of surface parking lots can conflict with providing desired urban form and densities. Multi-level parking garages, which use land more efficiently, are expensive to build.

The Eugene Code contains key parking provisions as:

- Minimum and maximum parking requirements for cars and bikes;
- Reduction of minimum parking requirements with an approved strategy according to the *Standards for Transportation Demand Management Program (2005)*;
- Parking exemptions in the downtown, West University Neighborhood, and Blair Boulevard Historic commercial area;
- Provisions for the shared use of parking spaces;
- Inclusion of on-street parking toward meeting off-site parking needs in some circumstances.

These code provisions can be further supported by enforcement and permitting practices, management of future parking supply in key employment areas, enhanced public information, improving multimodal access into the downtown and to the University of Oregon, regular revision of the City's *Bicycle Parking and Motor Vehicle Parking and Loading Standards* to reflect current needs and circumstances, and other operational strategies promoted by the *2035 TSP* policies and potential actions.

Rail

The needs analysis identified rail as an important, energy efficient mode of freight transportation. The *2035 TSP* supports the continued use of freight rail tracks and service provided in Eugene by Burlington-Northern Santa Fe (BNSF), Central Oregon and Pacific (COPR), Union Pacific (UP), and Portland and Western (P&W).

The needs analysis also identified passenger rail as an important strategy for providing energy efficient passenger travel between Eugene and other regional destinations. ODOT is currently studying improvements to allow higher speed, more frequent, and reliable passenger rail between Eugene-Springfield and Vancouver, Washington. The *2035 TSP* supports continued, regional passenger service by Amtrak to the Eugene Amtrak Station in downtown, the construction of two rail sidings and a new passenger platform that will enhance passenger rail service and separate passenger rail from freight at the Eugene Depot. These projects are shown in Chapter 5.

Federal law requires trains to sound their horns prior to entering at-grade crossings to warn motorists, bicyclists, and pedestrians that the train is approaching. Since February 2008, the Eugene City Council has supported establishing a "railroad quiet zone" to reduce friction between rail activity and the areas' residential and commercial activities. In downtown Eugene and the Whiteaker neighborhood, the neighborhoods closest to the station and where trains blow horns most frequently, the use of train horns would be reduced through the use of supplemental safety measures at street crossings of the UP railroad tracks. While a citywide railroad quiet zone is a long term objective, the Downtown-Whiteaker project is identified as a 20 year priority in this TSP.

Eugene Airport

The Eugene-Springfield region is served by the City of Eugene's Airport at Mahlon Sweet Field (EUG). This airport is located north of the Eugene UGB. The *2035 TSP* supports continued use of the airport for freight and passenger travel as well as for military use, Civil Air Patrol, the Lane Community College Aviation Academy, and as a base of operations for the aerial suppression of large-scale fires by specially-modified aircraft. Typically, such aircraft are contracted by the Oregon Department of Forestry or the U.S. Forest Service.

Eugene Airport Terminal

Source: City of Eugene

The roadway improvements proximate to the airport included in Chapter 5 will enhance opportunities for industrial development and employment opportunities that support airport activity. Further, to provide transportation options for the transportation disadvantaged, the *2035 TSP* encourages improved transit connections to the airport.

The Federal Aviation Administration (FAA) requires the creation of an Airport Master Plan to assist airports with expansion and improvement plans over a 20-year planning period. The 2010 Airport Master Plan Update for the Eugene Airport, adopted by the City and Lane County as a refinement to the *Metro Plan*, provides a development and expansion framework for the 20-year planning period starting from base year 2006. The *2035 TSP* recognizes the 2010 Airport Master Plan Update and incorporates its findings and goal by reference. The Master Plan Update is included in Appendix L of Volume 2. A master plan update process is underway and will be completed by the end of 2017.

Waterways

Over time, waterways have significantly shaped the evolution of Eugene's transportation and land uses. However, their influence as an active component of the transportation network is limited today.

Although the Willamette River is considered a navigable waterway for the purposes of determining public ownership, it is too shallow to be navigable for commercial purposes. Today, there are no ports or navigational facilities within Eugene, nor are any planned.

The Willamette River is a designated water trail that extends from Portland to south of Eugene. Water trail improvements that may be proposed for recreational purposes would be reviewed by policies contained in the Eugene *Parks, Recreation and Open Space Comprehensive Plan*, *Metro Plan*, *Envision Eugene Comprehensive Plan* (future), and other applicable City policy documents and codes.

Pipeline Facilities

Pipelines provide transportation opportunities in Eugene by moving liquids and gases throughout the community. Connections to trains or trucks for local distribution are required. Maintenance and operations of the major pipelines are outside the jurisdiction of the City; therefore no policies or projects directly related to the pipelines are proposed. The *2035 TSP* includes policies that support projects and regulations that reduce transportation inefficiencies and risks from the transportation of hazardous materials, such as when natural gas or oil is transferred between pipelines, trucks, and trains for local distribution.

Chapter 5: Transportation Priorities and Project Categories

The *2035 TSP* recommends transportation programs and infrastructure improvements to fulfill the plan's goals and policies. These are organized into the following five categories that suggest timeframes for implementation based on complexity, likely available funding (including potential funding sources), and assessment of need:

- Projects to be completed within 20 years;
- Operational projects (on-going);
- Projects to complete upon development;
- Projects to be completed beyond 20 years;
- Study projects.

Inclusion of a project in the next 20-years or beyond 20 years does not represent commitment to complete the project during that timeframe. It is expected that some projects may be accelerated and others postponed due to changing conditions, funding availability, public input, or more detailed study performed during programming and budgeting processes. Also, the projects described in these lists represent the best estimation for appropriate design available at time of TSP adoption. Since the TSP was drafted at a high-level citywide scale, project design may change before construction commences as public input, available funding, and unique site conditions are taken into consideration.

Achieving *2035 TSP* goals and the City's commitment to creating a transportation plan that supports the **Triple Bottom Line** were assessed using eight evaluation criteria:

1. Safety and health
2. Social equity
3. Access and mobility for all modes
4. Community context
5. Economic benefit
6. Cost effectiveness
7. Climate and energy
8. Ecological function

Prior to commencing a capital transportation project, the City staff does their best to reach out to and engage the community. In determining the appropriate amount of public involvement for a particular project, the City considers the scale, scope and potential impacts of the project.

Project Costs

Costs for each 20-year priority project and projects to complete upon development are provided in the subsequent tables. These costs are order-of-magnitude or planning-level estimates that include an estimate of right-of-way, design engineering and construction; these costs generally include a 30 percent contingency. All costs are rounded and provided in 2014 dollars.

Costs for individual transit corridors are not provided. Given that a community process will be required to determine the types of improvements necessary to support transit in identified multimodal corridors, transit corridor capital costs were consolidated, assuming a mix of bus rapid transit (EmX), enhanced bus corridors, and frequent bus service. Transit projects are estimated to cost a total of $171.4 million for all corridor improvements.

Projects within 20 Years

The projects shown in Tables 5.1 and 5.2 represent the City's current priorities for implementation in the next 20 years (up to the year 2035). Projects in this category may be funded through a variety of sources including federal, state, or local transportation funds, system development charges (SDCs), through partnerships with private developers, or a combination of these sources. Roadway, multimodal, transit, and rail projects to be completed within 20 years can be seen on a project map in Attachment A, Figure 2. Pedestrian project can be seen on Attachment A, Figure 3 and bicycle projects can be seen on Attachment A, Figure 4.

Table 5.1: Roadway, Multimodal, Transit, and Rail Projects to be Completed Within 20 Years[10]

Project No.	Name/Location	Extent	Length (miles)	2014 Cost Estimate
River Road				
MM-1	Improve frequent transit service and multimodal travel along River Road	Hunsaker Lane to West 11th Avenue	Included in transit/multimodal corridor bundle[11]	
MM-2	Future Santa Clara Community Transit Center: new transfer station at River Road and Hunsaker Lane to facilitate bus transfers, park and ride, bike parking	River Road and Hunsaker Lane	Included in transit/multimodal corridor bundle	
Randy Papé Beltline Highway Facility Plan Recommendations				
MM-3	Construct multimodal local arterial bridge over the Willamette River to the north of the Beltline Highway, connecting Division Avenue to Green Acres Road; construct operational improvements to existing Randy Papé Beltline Highway/Delta Highway ramps consistent with the Beltline Highway Facility Plan	River Road to Coburg Road	0.95	$83M
I-5/Beltline				
MM-4	Improve I-5/Randy Papé Beltline Highway interchange (project is currently funded and underway)	I-5/Randy Papé Beltline Highway interchange	Funded and under construction[12]	
Highway 99				
MM-5	Improve frequent transit service and multimodal travel along Highway 99	Downtown to Barger Drive	Included in transit/multimodal corridor bundle	

[10] The cost estimates for all Key Corridor projects shown in Table 5.1 are based on previous corridor improvements completed in the City of Eugene. Average improvement costs were used based on past local transit corridor improvement costs and assumptions about the level of transit improvements that may be appropriate for each corridor within a 20 year period. These costs will be refined as individual corridor studies provide more accurate estimates.

[11] Costs for multimodal corridors are not provided for each corridor because additional work must be done prior to determining the appropriate transit, bike and pedestrian treatments. A combination of bus rapid transit (EmX) and enhanced bus service was assumed in developing the multimodal corridor project bundle cost provided below.

[12] Costs and mileage for projects under construction are not included as funding has already been programmed.

Project No.	Name/Location	Extent	Length (miles)	2014 Cost Estimate
Coburg Road				
MM-6	Improve frequent transit service and multimodal travel along Coburg Road and transit connections to Springfield	Eugene Station to I-5/Crescent Avenue	Included in transit/multimodal corridor bundle	
Martin Luther King Jr. Boulevard				
MM-7	Improve frequent transit service and multimodal travel along Martin Luther King Jr. Boulevard to Centennial Boulevard in Springfield	Coburg Road to I-5	Included in transit/multimodal corridor bundle	
MM-8	Add center turn lane on Martin Luther King Jr. Boulevard	Leo Harris Parkway West and Centennial Loop West	0.21	$6.7M
West Eugene EmX				
MM-9	West Eugene EmX extension along W 6th, 7th, and 11th Avenues, Garfield and Charnelton Streets (project is currently funded and under construction)	Commerce Street to Eugene Station	Funded; under construction	
30th Avenue/Amazon Parkway				
MM-10	Achieve frequent transit service and improved multimodal travel along the 30th Avenue and Amazon Parkway corridor; enhance pedestrian crossings and provide protected bikeways in the corridor (note: only the portion of the project within Eugene's UGB is included in the TSP)	Downtown to Lane Community College	Included in transit/multimodal corridor bundle	
Complete Street Upgrades of Existing Streets				
MM-11	Upgrade Hunsaker Lane/Beaver Street consistent with major collector/urban collector standards	River Road to Division Avenue	1.1	$9.3M
MM-12	Upgrade the north/south section of County Farm Road consistent with major collector standards	Wildish Lane/County Farm Road to Coburg Road	0.7	$4.4M
MM-13	Upgrade Bethel Drive consistent with neighborhood collector standards	Highway 99 to Roosevelt Boulevard	1.7	11.8M
MM-14	Upgrade W 11th Avenue consistent with major arterial standards	Terry Street to Green Hill Road	1	$12.3M
MM-15	Upgrade Jeppesen Acres Road consistent with its designation as a bike boulevard and neighborhood collector	Gilham Road to Providence Street	0.7	$3.9M
MM-16	Upgrade Bertelsen Road consistent with minor arterial standards.	18th Avenue to Bailey Hill Road	0.57	$3.9M

Project No.	Name/Location	Extent	Length (miles)	2014 Cost Estimate
Other Projects				
MM-19	Reconstruct Franklin Boulevard pursuant to the Walnut Station Plan (for purposes of cost estimating a multiway boulevard design from this plan was used); make streetscape improvements including new sidewalks on the south side and a shared use path on the north side between Onyx and Alder Streets	Walnut Street to Onyx Street	0.6	$27.7M
MM-20	Add lanes on the Randy Papé Beltline Highway and provide intersection improvements at the Randy Papé Beltline Highway/W 11th Avenue and Randy Papé Beltline Highway/Roosevelt Boulevard intersections	Roosevelt Boulevard to W 11th Avenue	1.1	$28.1M
MM-21	Widen Barger Drive to provide a second through lane in each direction	West of Primrose Street to where the street widens to two lanes in each direction west of Randy Papé Beltline Highway	0.14	$1.9M
MM-22	Convert 8th Avenue to two-way street	High Street to Jefferson Street	0.7	$3.9M
MM-26	Neighborhood traffic calming to address speeding problems on residential streets including collector streets	Various locations	N/A	$2.0M
MM-27	Upgrade North Gilham Road consistent with neighborhood collector standards	Ayres Road to Ashbury Drive	0.3	$1.5M
MM-28	Extend Shadowview to Coburg Road (or beyond to Park View Drive) via Spectrum Avenue to serve future development consistent with neighborhood collector standards	Shadowview Road to Coburg Road (may extend to Park View Drive)	0.3	$3.2M
Rail Improvements				
MM-23	Improve passenger platform and construct new rail sidings to enhance passenger rail service and separate passenger rail from freight rail at the Eugene Depot	Eugene Depot	N/A	$20.3M
MM-24	Establish Railroad Quiet Zone; assumes 10 crossings	Downtown and Whiteaker neighborhoods	N/A	$5M

Project No.	Name/Location	Extent	Length (miles)	2014 Cost Estimate
MM-25	Relocate highway-railroad crossing in alignment with the existing 8th Avenue improvements including track panels, lights, relocated signal, gates, audible warning devices, upgraded railroad track detection as required by ODOT Rail and/or Union Pacific Railroad, and an accessway to establish a walking and bicycling connection to the South Bank Path	Near 8th Avenue with connection to South Bank Path	0.03	$3.1M
Transit/Multimodal Corridor Bundle (Projects MM-1, 2, 5, 6, 7 and 10)			15.2	$171.4M
20-year total for all projects			**25.9**	**$406.6M**

Table 5.2: Pedestrian and Bicycle Projects to be Completed Within 20 Years

Project No	Name/Location	Extent	Length (miles)	2014 Cost Estimate
Accessways				
PB-196	Avalon Street Accessway	Candlelight Dr to N Danebo Ave	0.10	$87,000
PB-197	Lane County Fairgrounds Accessway	W 13th Ave to W 16th Ave	0.27	$186,000
PB-218	Hansen Lane Accessway	River Rd to West Bank Path	0.12	$98,000
PB-220	McClure Lane Accessway	McClure Ln to West Bank Path	0.05	$45,000
PB-221	Arbor Drive Accessway	Denis Dr to West Bank Path	0.06	$46,000
PB-230	Murin Street Accessway	Murin St to Fern Ridge Path	0.02	$16,000
PB-250	W 11th Avenue Accessway	W 11th Ave to Fern Ridge Path at Quaker	0.06	$53,000
PB-255	W 27th Avenue Accessway	Madison St to Jefferson St	0.07	$61,000
PB-256	Lincoln Street Accessway	W 30th Ave to W 31st Ave	0.08	$66,000
PB-258	Spyglass Accessway	Spyglass Dr to Greenview St	0.08	$64,000
PB-259	Holly Avenue Accessway	Delta Oaks Dr to Holly Ave	0.04	$31,000
PB-472	E 25th Avenue Accessway	University St to E 25th Ave	0.01	$9,000
PB-560	Wallis Street Path	W 13th Avenue to Peppertree Accessway	0.06	$48,000
		20-Year Total	**1.02**	**$810,000**

Notes: *Urban indicates that costs are incorporated into other projects along the same roadway in the Table 5.1. *Upon development indicates that costs are incorporated into other projects along the same roadway in the Table 5.3.

Traffic Signal System Improvements

Traffic signal system improvements (sometimes categorized as “operational projects”) are typically related to modifications to intersections that are lower in cost than a typical roadway project and are ones that generally do not require right-of-way acquisition. The *2035 TSP* is not inclusive of all of the traffic signal projects or intersection projects that the City will pursue over the life of the *TSP*. Rather, the projects highlighted are those that the City can pursue to strategically improve the operational efficiency of specific intersections and important roadways. These projects can enhance system operations and can be completed as opportunities arise. These projects may be funded by City maintenance and operations funds, SDCs, and other local, regional and state funding sources.

Below are the list of operational projects for inclusion in the TSP.

- **New Traffic Signals** – Installation of new traffic signals at intersections meeting one or more signal warrant(s). There are currently 25 intersections that have been identified as meeting warrants today. All of these intersections are on arterial and collector streets. The estimated cost to install a new traffic signal system is $350,000 per intersection.

- **Strain Pole/Span Wire Replacement** – Citywide, 24 traffic signals today are constructed using strain poles/span wires. Over time, the City will need to modify these intersections with mast arms and traffic signal equipment that conforms to current standards. Retrofitting all of the intersections will cost approximately $3,000,000. Of the 24 locations, 21 are at arterial and collector intersections.
- **Accessible Pedestrian Signals (APS)** – There are 228 signalized intersections within the UGB that do not have accessible pedestrian signal devices. Of these, 131 are located in Priority 1 areas and 83 are located in Priority 2 areas as identified in the ADA Transition Plan for Public Right of Way. The estimated cost of installation of APS devices ranges from $20,000 to $50,000 per intersection depending on the existing signal system being retrofitted.
- **Master Traffic Communications Plan** – Implementing a master plan will upgrade the existing communications infrastructure to increase the overall efficiency of the transportation system. This plan will support future improvements (*e.g.* new traffic signals, cameras, dynamic message boards and weather stations) and provide infrastructure to ensure that all traffic signals are coordinated on the same communication system. Today, 15 percent of the traffic signals are not part of an overall system. The communications project list includes nine phases of fiber trunk lines with a total estimated cost of $9,500,000 (2008 dollars).

Upon Development Projects

As properties develop or redevelop, the following projects would be completed to serve new development. The timing of these projects is uncertain and they are unlikely to be advanced by the City in the absence of specific private development activities. Typically, these projects address only localized transportation needs associated with newly developing or redeveloping areas.

The list of projects to be completed upon development reflects the City's current understanding of likely priorities in these areas. At the time that development or land use applications are submitted, additional or different provisions may be required as conditions of approval based on the specifics of the actual development application and the applicable land use regulations. The projects in this category may also be funded through a variety of sources, such as urban renewal, private funds, SDCs, or proportionate sharing (based on level of anticipated impact of a specific development). Table 5.3 shows the projects to be completed upon development.

Projects to be completed upon development can be seen on a project map in Attachment A, Figure 5.

The Complete Street Upgrades of Existing Streets section of Table 5.3 (Projects to be Completed Upon Development) also includes streets that are primarily lined with single family residential development. In the absence of redevelopment, Complete Street projects on these streets could be implemented as capital projects and are considered secondary in priority to the Complete Street Upgrade of Existing Streets projects in Table 5.1 (Roadway, Multimodal, Transit and Rail Projects to be Completed Within 20 Years).

Table 5.3: Projects to be Completed Upon Development

Project No.	Name/Location	Extent	Length (miles)	Cost
Local Connectivity				
UD-1	Provide connection with major collector standards	Enid Road to Awbrey Lane	0.8	$7.4M
UD-2	Connect Hyacinth Street consistent with neighborhood collector standards	Irvington Drive to Lynnbrook Drive	0.1	$700,000
UD-3	Provide connection between Gilham Road and County Farm Road consistent with neighborhood collector standards	Gilham Road to County Farm Road	0.4	$2.8M
UD-5	Extend Legacy Street south past Royal Avenue to connect to Roosevelt Boulevard (Roosevelt extension)	Adelman Loop to Roosevelt Boulevard	1.4	$17.5M
UD-6	Extend Colton Way south past Royal Avenue to connect with the future extension of Legacy Street consistent with neighborhood collector standards	Royal Avenue to future extension of Legacy Street	0.6	$3.7M
UD-7	Construct collectors and other facilities within Crow Road/West 11th Avenue/Pitchford area needed to serve future development	Crow Road/West 11th/Pitchford	1.3	$21.3M
UD-8	Extend W 13th Avenue consistent with major collector standards	Bertelsen Road to Dani Street	0.3	$3.6M
Urbanization of Existing Streets				
UD-9	Upgrade Awbrey Lane consistent with major collector standards	Prairie Road to Highway 99	1.3	$8.7M
UD-10	Upgrade Beacon Drive East consistent with neighborhood collector standards	River Road to Scenic Drive	0.7	$3.5M
UD-11	Upgrade Scenic Drive consistent with neighborhood collector standards	River Loop #2 to East Beacon Drive	0.8	$4.3M
UD-12	Upgrade Spring Creek Drive consistent with neighborhood collector standards	River Road to Scenic Drive	0.5	$2.6M
UD-13	Upgrade River Loop #2 consistent with neighborhood collector standards	River Road to Burlwood Street	1	$6.4M
UD-14	Upgrade Wilkes Drive consistent with major collector standards	River Road to River Loop #1	1	$7M
UD-15	Upgrade River Loop #1 consistent with neighborhood collector standards	River Road to Dalewood Street	0.3	$1.5M
UD-19	Upgrade County Farm Road, west to east section	Wildish Lane to Coburg Road	0.5	$3.2M
UD-20	Upgrade Royal Avenue consistent with minor arterial standards	Terry Street to Green Hill Road	1	$11.2M
UD-21	Upgrade Willow Creek Road south consistent with neighborhood collector standards	W 18th Avenue to the UGB	1	$5.1M
UD-22	Upgrade Bailey Hill Road south consistent with minor arterial standards	Warren Street to the UGB	1.6	$9.9M
UD-23	Upgrade Dillard Road consistent with major collector standards	43rd Avenue to the UGB	1.4	$8.1M
UD-24	Upgrade Fox Hollow Road consistent with major collector standards	Donald Street to the UGB	0.9	$5.7M
		20-Year Total	**16.9**	**$134.2M**

Projects Beyond 20 Years

Projects that would be implemented after 20 years are still important to consider because they could be needed to address future transportation issues, or are simply not able to be funded within the 20 year planning horizon of the *2035 TSP*. Inclusion of projects in the beyond 20 year category provides the City flexibility to re-evaluate priorities and to pursue a variety of funding opportunities that may arise over the life of the *2035 TSP*. Table 5.4 shows the projects expected to be completed beyond the 20 year planning horizon. The City has not identified cost estimates for these long term projects.

Projects to be completed beyond 20 years can be seen on a project map in Attachment A, Figure 6. Pedestrian projects to be completed beyond 20 years are shown on a project map in Attachment A, Figure 7 and bicycle projects to be completed beyond 20 years are shown in Attachment A, Figure 8.

Table 5.4: Projects to be Completed Beyond 20 Years

Project No.	Project Description
Northwest Expressway	
B-2	Provide improvements to facilitate vehicle movement along the Northwest Expressway corridor
Randy Papé Beltline Corridor	
B-3	Improve frequent transit service along the Randy Papé Beltline Highway corridor with a possible Crescent Avenue route
B-4	Improve Randy Papé Beltline Highway from River Road to Coburg Road consistent with the Beltline Highway Facility Plan (arterial bridge and some improvements to Delta Highway/Beltline Highway interchange are included in 20 year project list)
Intersection Projects	
B-5	Provide improvements to address safety and delay at the Highway 99/Roosevelt Boulevard intersection
Complete Street Upgrades of Existing Streets	
B-6	Upgrade Summit Avenue from Fairmont Boulevard to Floral Hill Drive consistent with neighborhood collector standards
B-7	Upgrade Van Duyn Street from Western Drive to Harlow Road consistent with neighborhood collector standards
I-5 from I-105 to South Urban Growth Boundary	
B-8	Improve I-5 to six lanes; improve ramps and upgrade bridges

Study Projects

The *2035 TSP* has identified a number of potential projects that need more study before the community considers specific recommendations. This *TSP* cannot cover the issues and level of detail that would be needed to create project recommendations for these concepts. Therefore, the City would need to create individual neighborhood-scaled refinement or design plans for each project as timing allows and funding becomes available. These plans can identify specific recommendations, cost estimates, potential funding sources, and the timing for implementation. These projects are not included on the City's SDC list and would only be added if the *2035 TSP* were amended to reclassify one or more of these projects as those to be completed within 20 years. Study projects are shown in Table 5.6.

Table 5.6: Study Projects

Project No.	Project Description
11th and 13th Avenues	
S-1	Study the need for enhanced transit service along 11th and 13th Avenues between downtown and Garfield Street
Local Connectivity	
S-2	Extend Beaver Street north to Wilkes Drive (which is outside the UGB) as a joint project with Lane County either as a major collector or a pedestrian and bicycle connection; street extension would require obtaining a "Goal Exception" to Oregon's Statewide Planning Goals
Improvements to North-South Travel/Circulation South of Downtown	
S-3	Evaluate north/south circulation options on the Oak/Pearl Streets and Hilyard/Patterson Streets couplets
River Crossings	
S-4	Study ways to increase capacity over the Willamette River to address bridge crossing congestion issues
S-5	Address an aging Ferry Street Bridge structure
S-6	Investigate transit route options for access into downtown via or around the Ferry Street Bridge in conjunction with either Martin Luther King Jr. Boulevard or Coburg Road transit improvements
University of Oregon	
S-7	Explore ways to provide better multimodal connections between the University of Oregon/Franklin Boulevard area and the Autzen Stadium/Duck Village/Chase Gardens area
I-105 Ramps	
S-8	Analyze options to address weaving, operational and safety considerations at the I-105 southbound off-ramp onto W 6th Avenue
NW Expressway	
S-9	Study opportunities to improve the safety and functionality of Northwest Expressway as a major arterial street including by making intersection improvements at the Randy Pape Beltline Highway ramp termini and other locations, by improving signage, and by making other changes to the street
Alton Baker Park	
S-10	Develop lighting and width standards for shared use paths in East Alton Baker Park, particularly east-west routes and connections to the pedestrian and bicycle bridges.
Randy Papé Beltine Highway	
S-11	Study options to address congestion and local connectivity needs in the vicinity of the Coburg Road/Beltline Highway interchange
Coburg Road	
S-12	Connect Eugene to the planned Coburg Loop Trail by providing a walking and bicycling facility on Coburg Road. The study must be coordinated with Lane County and the City of Coburg.
Franklin Boulevard	
S-13	Examine options for improving bicycle and pedestrian access along Franklin Boulevard from the city limits to Alder Street and will be accomplished through planning and development of a multiway boulevard on Franklin as called for in the Walnut Station Mixed Use Center Plan.
Morse Family Farm Path	

S-14	Create recommendations for bicycle and pedestrian circulation through the Morse Family Farm to existing and planned routes that connect to the perimeter of the site
Rail Alignment Westbound	
S-15	Examine the feasibility of a rails-with-trails project for the Union Pacific (UPRR) rail line within the city limits. The study must be coordinated with UPRR and take into consideration plans for continued and expanded rail service to area businesses. The study should examine existing right-of-way, path alignment options, track crossing issues, connections to adjacent sidewalks and bikeways, and next steps for negotiating with UPRR.
West Bank Path	
S-16	Examine the feasibility of extending the West Bank Path north to Hileman Landing. Right-of-way ownership and environmental concerns should be addressed in the final recommendation.
Willamette McKenzie Path	
S-17	Examine options for creating a path north along the east side of the Willamette River and east along the McKenzie River as called for in the Regional Transportation Plan. The study should build on the work done by the Willamette River Open Space Vision and Action Plan and look at land ownership, alignment alternatives, environmental issues, and recreational and scenic value.
South Bank Gap	
S-18	Examine options and develop a recommended facility for completing the South Bank Path gap between the Frohnmayer and Knickerbocker Pedestrian and Bicycle Bridges. The plan must consider the existing railroad line.
Westmoreland Park Paths	
S-19	Examine options to create paths through Westmoreland Park to connect to existing on-street walking and bicycling routes that connect to the park.

Randy Papé Beltline Facility Plan

The Randy Papé Beltline Facility Plan is adopted as part of the *2035 TSP* (Attachment C). The Facility Plan includes recommended improvements to the Randy Papé Beltline Highway, Delta Highway and the adjacent arterial street system to improve safety and the long-term operations of the highway between River Road and Coburg Road. This Facility Plan is a precursor to the National Environmental Policy Act (NEPA) process for the implementation of future Randy Papé Beltline Highway projects. The NEPA analysis will include more detailed and rigorous analysis of project impacts and result in a determination as to whether or not one or more of the improvements options can be constructed and, potentially, result in a project that is eligible for federal funding.[13]

[13] If the outcome of the NEPA analysis is that one or more of the improvement options can be constructed, the project description and costs estimates for Project MM-3 will be updated to reflect the improvement option ultimately selected. The City recognizes that construction outside of the urban growth boundary may require a goal exception or UGB amendment. Those land use issues will be resolved together with Lane County.

The Randy Papé Beltline Facility Plan identifies concerns regarding safety, operation, and capacity of Beltline Highway and its interchanges at Delta Highway, River Avenue/Division Avenue, and River Road in both objective and subjective ways. The Facility Plan describes four potential improvement options: No Build, Improve Existing, Auxiliary Lane, and Collector Distributor.

Both the Improve Existing and Auxiliary Lane options provide auxiliary lanes and improved, safer access to the existing Beltline mainline, and provide a local arterial street connection parallel (to the north) to the existing bridge. Both options meet the project objectives and can provide better facilities for walking, biking, and transit. The Collector Distributor option, however, was found to be inconsistent with the direction espoused by the TSP. Compared to the Improve Existing and Auxiliary Lane options, the Collector Distributor option has significantly higher costs with only a marginal improvement to corridor operational performance, inability for phased construction, likelihood of greater impacts to the surrounding community, and would be less hospitable for walking, biking, and transit. Thus, based on City Council direction provided on September 30, 2015, adoption of the Randy Papé Beltline Facility Plan as part of this TSP does not include the Collector Distributor option. Only the No Build, Improve Existing, and Auxiliary Lane options will be subject to NEPA review.

What is NEPA?

The **National Environmental Policy Act (NEPA)** is a United States environmental law (enacted in 1970) that promotes the enhancement of the environment and establishes the broad national framework for protecting our environment. NEPA requires federal agencies to assess the environmental effects of their proposed actions prior to making decisions.

Traffic on Beltline Highway at River Avenue during evening rush hour.

Source: City of Eugene

Chapter 6: Transportation Funding and Implementation

The *2035 TSP* includes projects under the jurisdiction and ownership of ODOT, Lane County, the City of Eugene, and Lane Transit District (LTD), as well as projects that will be implemented by private developers. Individual TSP projects will be funded through a different combination of federal, state, City, county, SDC revenue, and or private sources. This chapter discusses current and possible new funding mechanisms that may be available to implement projects during the life of the *2035 TSP.* A complete list of the multimodal projects included in the *2035 TSP* is provided in Chapter 5 (Tables 5.1-5.6). Chapter 5 also provides planning-level cost estimates for each of the projects.

Today's fiscal environment is beset by uncertainty about future federal, state and local funding for transportation projects. This uncertainty provides challenges to accurately forecast the amount of funding available for transportation investments, and what projects or programs will receive funding. In this context, the *2035 TSP* provides a prudent and conservative list of capital construction projects, an emphasis on lower cost methods of improving personal mobility within the City, and an increased reliance on technologies that can improve the efficiencies of our streets.

The *2035 TSP* articulates policies and actions that explicitly prioritize facilities and improvements that support mixed-use, pedestrian-friendly neighborhoods, increase use of active modes of transportation, and reduce reliance on travel by single-occupant automobile. These priorities include improved convenience and safety for walking, biking, and connections to transit stops; improved transit service in Key Corridors; bikeway improvements near the University of Oregon, downtown Eugene, and on streets connecting residential areas to schools and commercial hubs; a railroad quiet zone in the downtown and Whiteaker areas; investments that facilitate job growth in commercial or industrial areas; and priority parking and reduced parking fees for non-gasoline powered vehicles.

The highest priority projects in the *2035 TSP*, the Eugene Capital Improvement Program (CIP) and Eugene projects in the Metropolitan Transportation Improvement Program (MTIP) are those that (1) protect the existing system and (2) improve the efficiency and safety of existing facilities. These projects are to be implemented first unless a lower priority measure is demonstrated to be more cost-effective or is one that better supports safety, growth management, or other livability and economic considerations.

The *2035 TSP* promotes a series of projects that make streets safer and more efficient with use of emerging technologies. These actions increase the capacity and safety of the streets without adding general purpose lanes. Examples of technological improvements could include: traffic signal upgrades and communications, traffic monitoring cameras, dynamic message boards, and weather stations.

While the *2035 TSP* prioritizes projects for implementation, the City may advance projects in a different manner than anticipated in the TSP to take advantage of unforeseen opportunities. These opportunities could include changes in policy or funding at the federal, state, or local level; changes in local development priorities; or the formation of public-private or public-public partnerships. The prioritization of projects identified as within 20 years are intended to be interpreted flexibly with those that are identified as "beyond 20 years" to allow the City to make wise investment decisions consistent with the overall vision contained in the *2035 TSP*.

Transportation Revenue

Revenue forecasts from the Central Lane Metropolitan Planning Organization Regional Transportation Plan (RTP) (December 2011 and reviewed by Central Lane Metropolitan Planning Organization and ODOT staff in 2015) provided a basis for extrapolating an estimate of revenues that might be available for transportation projects in the City of Eugene over the next twenty years. The RTP, per federal guidance, includes sources of funds that can be reasonably expected, rather than just those sources currently available to the region and/or used for capital projects. These RTP funding projections are coordinated with ODOT and other Metropolitan Planning Organization in the state. Because the funding picture in the region is constantly evolving and some indications from state forecasts suggest that funding levels might decline, this chapter also outlines a potential scenario where funding is more constrained than the RTP forecast might suggest.

Safe Routes to School events encourage parents and children to use active modes to reach schools.

Regional Transportation Plan Forecasts

The 2035 Central Lane MPO RTP (2011) forecasts constrained costs and revenues for the transportation system in the Central Lane MPO through Fiscal Year 2035. These forecasts include the following capital revenue and cost categories:

- Local system improvements;
- Pedestrian and bicycle system improvements;
- Lane Transit District system improvements;
- ODOT system improvements.

The RTP forecasts assume a variety of sources for each category. For the City of Eugene, a variety of federal, state and local revenue sources contribute to each category, as shown in Table 6.1 below.

Approximate Transportation Revenues for the City of Eugene

Setting aside expected revenues for operations, maintenance, and preservation and transit system improvements, the RTP estimates approximately $650 million (in 2014 dollars) in funding for roadway system, bike, and pedestrian capital improvements through Fiscal Year 2035. Assuming that approximately 65 percent[14] of all transportation investments (including ODOT funding) are spent on city, county or state projects within Eugene, the RTP forecasts that between $398 and $415 million (in 2014 dollars)[15] in transportation revenues will be available for City of Eugene roadway system, bike, and pedestrian improvement projects through Fiscal Year 2035.

[14] Approximately 65 percent of the population within the Central Lane Metropolitan Planning Organization boundary is within the City of Eugene.

[15] Approximately $385 to $400 million in 2011 dollars. Assumed 3.1 percent annual inflation to determine 2014 dollars.

The state and federal funding picture is changing rapidly. In this light, ODOT may have less revenue to invest in major roadway projects in the future. In a reduced revenue scenario, ODOT may have only $60-80 million (in 2014 dollars) available for projects on ODOT facilities in Eugene. This change would minimally impact revenues for local system improvements. If this is the case, Eugene could expect $260-$280 million in revenues for transportation projects identified in the *2035 TSP*. Both revenue scenarios are shown in Table 6.1.

Table 6.1: Forecast revenue and potential sources for capital projects in Eugene

Project category	RTP forecast (2014$, millions)	Potential reduced funding scenario (2014$, millions)
Local system improvements (roadway, on and off-street pedestrian and bike)	$200	$200
Sources include: System development charges Federal highway trust fund (MPO allocation: STIP-U and Transportation Alternatives) State Transportation Enhancement program General Obligation Bonds Developer contributions Special federal programs or earmarks		
ODOT discretionary improvements (range)	$198-214	$60-80
Sources include: State Transportation Enhancement program Federal highway trust fund (not sub-allocated to MPOs, counties or cities) State gas tax (not sub-allocated to MPOs, counties or cities) State legislative actions Special federal programs or earmarks		
Total revenue	$398-414	$260-280

Note: under state law, state gas tax revenues can only be used for projects within a road right-of-way (including pedestrian and bike projects).

Project Costs

Chapter 5 includes order-of-magnitude costs for projects anticipated in the next 20 years, including:

- Projects within 20 years (transit, roadway and multimodal);
- Pedestrian and bicycle projects;
- Those projects anticipated upon development/redevelopment;
- Traffic signal system improvements.

The costs are in 2014 dollars and include right-of-way, design engineering, and construction costs. A summary of costs for the 20 year system is shown in Table 6.2.

Capital funding for transit is not included in the cost and funding analysis. Given that a community process will be required to determine the types of improvements necessary to support transit in identified multimodal corridors, the transit corridor capital costs were consolidated, assuming a mix of bus rapid transit (EmX), enhanced corridor, and frequent bus service. Transit projects are estimated to cost a total of $171.4 million for all corridor improvements.

Table 6.2: 20 year system cost

Project category	Cost ($2014)
Projects within 20 Years	
Roadway and multimodal projects	$161,200,000
Complete streets upgrades to existing streets	$45,600,000
Rail projects	$28,400,000
Pedestrian and bicycle projects	$72,000,000
Transit projects in multimodal corridors (multimodal corridor bundle)	$171,400,000
Upon Development Projects	$134,200,000 (total) / $67,100,000 (city-funded)
Traffic Signal System Improvements	$21,200,000
Total 20 Year System Cost	**$634,000,000**
Total ODOT and City-Funded Cost (excluding transit and 50% of upon development projects)	**$395,500,000**

Note: (1) City-funded share of 'upon development' project costs is an estimate for use in comparing costs to forecast revenues. Assessments for development will be developed separately. (2) Often, operational projects are not included in system plans. Some are included in this funding estimate, however, due to the reliance on operational improvements to address system performance needs.

Funding Gap

Forecasts of the likely funding gap looks at street, pedestrian, bicycle and traffic signal system improvements expected to be completed in 20 years. Traditionally only about half of the cost of projects anticipated upon development are borne by private developers; the remaining portion is often City funded. Transit projects are not included in this gap analysis as they are expected to be constructed by the Lane Transit District with a mix of local contributions and Federal Transit Administration (FTA) grants. Depending on the funding plan for individual transit projects, the City may be asked to contribute.

With transit and a half of upon development projects set aside, the total cost of projects to be completed in 20 years is $395.5 million while forecast revenues are $398-$415 million (RTP forecast) or $260-280 million (reduced forecast). With the RTP scenario, Eugene can reasonably expect the forecasted revenues needed to construct its 20 year system of projects. With the more conservative scenario, the City would need new sources of funds to construct its 20 year priority system. Some options for new funds could include increased system development charges, one or more local bond measures, or a local option vehicle registration fee (only available at the county level). The City could also increase the local option gas tax or choose to spend local option gas tax or state gas tax revenues on these projects instead of directing those revenues to preservation, operations, and maintenance. Finally, the state legislature could identify additional funding for transportation projects.

Potential Funding Sources

While highway user taxes and fees, including Oregon State fuel taxes, licensing, and registration fees, as well as local fuel taxes, are available to fund transportation-related projects in the City, per local policy these sources have increasingly been devoted to operations, maintenance, and preservation. This practice diverts funds away from capacity development or expansion projects. The City will need to develop a strategy to fund the improvements listed in the *2035 TSP*. Possible elements of this strategy are outlined below.

Local Funding Mechanisms

At the local level, the City can draw on a number of potential funding mechanisms. Table 6.3 outlines potential funding sources at the local level that either can currently be used to fund future projects or that the City Council may want to consider adopting as a new funding source. The City has used some of these funding mechanisms in the past; others would be new. Inclusion of Table 6.3 in the *2035 TSP* does not create a new funding source but rather is intended to the various funding sources that local governments throughout Oregon utilized. In general, local funding sources are more flexible than funding obtained from state or federal grant sources.

Table 6.3: Potential Local Funding Mechanisms

Funding Source	Description	Potential Application in Eugene
Street Utility Fees (also called road maintenance fees)	A fee based on the number of automobile trips a particular land use generates; usually collected through a regular utility bill. Fees can also be tied to the annual registration of a vehicle to pay for improvements, expansion, and maintenance of the street system.	System-wide transportation facilities including streets, sidewalks, bike lanes, and shared use paths.
Transportation Systems Development Charge (SDC)	SDCs are impact fees assessed to development for the capacity demand it creates on public infrastructure systems. SDCs may be an improvement fee, a reimbursement fee, or a combination thereof. Reimbursement fee revenues are dedicated to capital projects that increase capacity to meet the needs of growth. SDC credits are provided to developers for public improvements they construct which add capacity to the system beyond that required to serve their development. SDC credits may also be given for development provisions that reduce vehicular capacity demand on the transportation system, such as providing end-of-trip bike facilities within the new development.	The City is updating its Transportation System Development Charge to reflect eligible components of the *2035 TSP* project list.
Stormwater SDCs, grants, and loans	SDCs, grants, loans, and stormwater improvement fees can be obtained for improving stormwater management facilities constructed as part of transportation system improvements.	SDCs may only be used for that portion of transportation improvements which generate additional stormwater management capacity related to growth.
Local gas tax	A local tax can be assessed on the purchase of gas within the City. This tax is added to the cost of gasoline at the pump, along with the state and federal gas taxes.	System-wide transportation facilities including streets, sidewalks, and bike lanes.

Funding Source	Description	Potential Application in Eugene
Parking in-lieu fees	Parking in-lieu fees are developer fees paid if they cannot or do not want to provide on-site parking for the development. The idea behind these fees is to decrease the amount of off-street, private parking and consolidating parking supplies on-street or in parking garages as a way to decrease parking demand on the development site. In-lieu fees may benefit developers by reducing costs and allowing more intensive development on a site.	System-wide transportation facilities including streets, sidewalks, bike lanes, shared use paths, and transit.
Incentives	The City provides an enticements such as bonus densities and flexibility in design in exchange for a public benefit. Examples might include a commute trip reduction (CTR) program or transit facilities in exchange for bonus densities. Incentives may be used with SDC methods to reduce transportation impacts from new development.	System-wide transportation facilities including streets, sidewalks, bike lanes, shared use paths, and transit.
Public/private partnerships	Public/private partnerships have been used around the country to provide public transportation amenities within the public right-of-way in exchange for operational revenue from the facilities. These partnerships could be used to provide services such as vehicle charging stations, public parking lots, bicycle lockers, or car share facilities.	System-wide transportation facilities including streets, sidewalks, bike lanes, shared use paths, and transit.
Tax Increment Financing (TIF)	TIF is a tool that cities may use to create special districts (tax increment areas) where public improvements are made in order to generate private-sector development. During a defined period, the City freezes the tax base at the pre-development level. Property taxes for that period can be waived or paid, but taxes derived from increases in assessed values (the tax increment) resulting from new development can go into a special fund created to retire bonds issued to originate the development or leverage future improvements. A number of small-to-medium sized communities in Oregon have implemented, or are considering implementing, urban renewal districts that will result in a TIF revenue stream.	System-wide transportation facilities including streets, sidewalks, bike lanes, shared use paths, and transit.
Streets District	Oregon state law (Oregon Revised Statute [ORS] 371) allows for the formation of special streets taxing districts for purposes of constructing and maintaining streets within the taxing district boundaries. A Streets District would be a separate entity from the City of Eugene, with its own property tax levy rate and an elected board of commissioners. Those within the potential district boundaries must vote on the creation of a Streets District.	Roadway improvement projects.

Funding Source	Description	Potential Application in Eugene
Revenue and general obligation bonds	Bonding allows municipal and county government to finance construction projects by borrowing money and paying it back over time, with interest. Financing requires smaller regular payments over time compared to paying the full cost at once, but financing increases the total cost of the project by adding interest. General obligation bonds are often used to pay for construction of large capital improvements and must be approved by a public vote. These bonds add the cost of the improvement to property taxes over time.	Construction of major capital improvement projects within the city, street maintenance and incidental improvements.
Reimbursement Districts	Also called Zones of Benefit or Advance Financed Districts, a city determines the boundary of the district. Property owners of new development or large redevelopment permits pay a fee for the installation of public improvements. They then recover some portion of the cost over a period of years (often 15).	Construction of major capital improvement projects within the city (possibly in Study Areas). A local code amendment is needed to permit Reimbursement Districts in Eugene.

State and Federal Grants

In addition to local funding sources, the City of Eugene can seek to leverage opportunities for funding from grants at the state and federal levels for specific projects. Table 6.4 outlines state and federal sources and their potential applications.

Potential state funding sources are extremely limited, with some having significant competition. Any future improvements that rely on state funding may require City and regional consensus that these improvements are more important than transportation needs elsewhere in the region and the state. It will likely be necessary to combine multiple funding sources to pay for a single improvement project (*e.g.*, combining state, regional, or City bicycle and pedestrian funds to pay for new bike lanes and sidewalks).

Table 6.4: Potential State and Federal Grants

Funding Source	Description	Potential Application in Eugene
Statewide Transportation Improvement Program (STIP)	STIP is the State of Oregon's four-year transportation capital improvement program. ODOT's system for distributing these funds has varied over recent years. Generally, local agencies apply in advance for projects to be funded in each four-year cycle.	Projects on any facility that meet the benefit categories of the STIP.
Statewide Transportation Improvement Program-Urban (STIP-U)	STIP-U is the State of Oregon's four-year transportation capital improvement program for urban areas. ODOT's system for distributing these funds has varied over recent years. Generally, local agencies apply in advance for projects to be funded in each four-year cycle.	Projects on any facility that meet the benefit categories of the STIP-U.
Transportation and Growth Management (TGM) Grants	TGM Grants are planning grants administered by ODOT and awarded on an annual basis. The TGM grants are generally awarded to projects that will lead to more livable, economically vital, transportation efficient, sustainable, and pedestrian-friendly communities. The grants are awarded in two categories: transportation system planning and integrated land use/transportation planning.	Refinement of any identified study projects.

Funding Source	Description	Potential Application in Eugene
Transportation Alternatives Program (TAP)	TAP is a federal program that provides funding for pedestrian and bicycle facilities, projects for improving public transit access, safe routes to schools, and recreational trails. Local governments, regional transportation authorities, transit agencies, school districts or schools, natural resource or public land agencies, and tribal governments are all eligible to receive TAP funds. TAP funds are programmed both by ODOT and the Central Lane MPO.	Bicycle and pedestrian facilities, shared use paths.
All Roads Transportation Safety Program (ARTS)	The federal Highway Safety Improvement Program is administered as ARTS in Oregon. ARTS provides funding to infrastructure and non-infrastructure projects that improve safety on all public roads. ARTS requires a data-driven approach and prioritizes projects in demonstrated problem areas.	Areas of safety concerns within the city, consistent with Oregon's Transportation Safety Action Plan.
Immediate Opportunity Fund (IOF)	This fund is discretionary and provides funding for transportation projects essential for supporting site-specific economic development projects. These funds are distributed on a case-by-case basis in cooperation with the Oregon Economic and Community Development Department. These funds can only be used when other sources of financial support are insufficient or unavailable. These funds are reserved for projects where a documented transportation problem exists or where private firm location decisions hinge on the immediate commitment of road construction. A minimum 50 percent match is required from project applications.	Any identified projects that would improve economic development in Eugene and where there are documented transportation problems.
Connect Oregon	Lottery-backed bonds distributed to air, marine, rail, transit, and pedestrian and bicycle projects statewide. No less than 10 percent of Connect Oregon IV funds must be distributed to each of the five regions of the state, if there are qualified projects in the region. The objective is to improve the connections between the highway system and other modes of transportation.	System-wide transportation facilities including, shared use paths, and transit.
Oregon Parks and Recreation Local Government Grants	Oregon Parks and Recreation Department administers this program using Oregon Lottery revenues. These grants can fund acquisition, development, and major rehabilitation of public outdoor parks and recreation facilities. A match of at least 20 percent is required.	Trails and other recreational facility development or rehabilitation.
Oregon Transportation Infrastructure Bank (OTIB)	A statewide revolving loan fund is available to local governments for many transportation infrastructure improvements, including highway, transit, and non-motorized projects. Most funds made available through this program are federal; streets must be functionally classified as a major collector or higher to be eligible for loan funding.	Infrastructure improvements to major collectors or higher classified roads for vehicle, transit, and non-motorized travel.
State highway gas tax increase or user fee	ODOT is currently researching a state user fee for drivers to address steady or declining state gas tax revenues. An increase in the state gas tax or a user fee would need to pass through state legislation and would increase the state's transportation funds.	System-wide transportation facilities including streets, sidewalks, bike lanes, and transit.

Relationship of the TSP and the Capital Improvement Program, City Code, and Design Standards

The *Eugene 2035 TSP* is implemented through coordinated actions with the Capital Improvement Program (finance), City Code (land use regulations), and street design standards.

The Capital Improvement Program (CIP) forecasts the City's capital funding needs over a six-year period based on various adopted long-range plans, goals and policies. The CIP plans for land acquisition, construction, and major preservation of public facilities necessary for the safe and efficient provision of municipal services identified from adopted master plans. The major transportation-related projects contained in the CIP are derived from the projects and needs identified in the *2035 TSP*. All transportation projects contained in the CIP must be consistent with the goals, objectives, policies, and needs identified in the Eugene Transportation System Plan.

In addition to the CIP funding mechanism, the tenets of the *2035 TSP* are implemented through various transportation- and land use-related sections of the Eugene City Code. The code dictates the process and standards by which development and street improvements are proposed, reviewed, and approved. The City Code also sets the standards for new development locations, bulk, and appearance; car and bike parking availability; pedestrian amenities; street connectivity; location of transit improvements; and the appearance of street rights-of-way.[16]

Street design standards are the basis for the design of all capital construction projects. Pursuant to policies contained in this TSP, street design standards will be updated to reflect best practices for expanding safety and convenience of the community's pedestrian, bicycle, and transit systems.

Monitoring and Reporting

Through its goals, policies, potential action items and projects, the 2035 TSP is designed to increase transportation choices and reduce reliance on the automobile. While the benchmarks set out in Attachment D will assure the City is making satisfactory progress toward meeting the standards approved by LCDC in 2001 for the entire Eugene-Springfield metro area, the City will also undertake Eugene-specific monitoring and reporting. Specifically, the City will periodically compile information that will be analyzed to measure the performance of the City's transportation system, including safety and congestion, and to evaluate the effectiveness of the 2035 TSP's goals, policies and programs. Further, transportation-specific monitoring is included in the policies for growth management monitoring that are being prepared as part of the Envision Eugene Comprehensive Plan.

[16] As discussed at the beginning of Chapter 2, the *2035 TSP* is an internally-directed document that provides a coordinated guide for City's changes to its transportation infrastructure and operations over the next 20 years. The *2035 TSP* is not an externally-applicable document, *i.e.*, no part of the *2035 TSP* serves as a "requirement" to which land use (or other) applicants must demonstrate compliance and the City will not use the policies of the *2035 TSP* in determining whether to approve or deny individual land use applications.

Attachment D: Alternative Performance Measure Benchmarks

LCDC-Approved Performance Measures (from TransPlan)	Benchmarks					How Measured
	2015	2020	2025	2030	2035	
% Non-Auto Trips "Active Mode Share"	17% (7% walk 8% bike)	24%	33%	40%	45%	% walking and biking trips ACS commute statistics and additional pedestrian and bike data as they becomes available from City & LCOG counts.
% Transit Mode Share on Congested Corridors	10%	12%	14%	16%	18%	LCOG data, LTD data (boardings) or ACS commute statistics (ACS=4.1% transit now)
Priority Bikeway Miles Definition of a "priority bikeway" project from *TransPlan* = Bike projects located along an essential core route on which the overall bicycle system depends; *and* (one of the following): 1. Fills in a critical gap in the existing bicycle system; or 2. Overcomes a barrier where no other nearby existing or programmed bikeway alternatives exist; or, 3. Significantly improves bicycle users' safety in a given corridor.		10	20	30	40	Number of new projects constructed that meet *TransPlan*'s definition of Priority Bikeway Miles.
Acres of zoned nodal development Definition of "nodal development" from *TransPlan* = a mixed-used, pedestrian friendly land use pattern that seeks to increase concentrations of population and employment in well-defined areas with good transit service, a mix of diverse and compatible land uses, and public and private improvements designed to be pedestrian and transit oriented.	1240	1530	1700	1870	2040	Number of acres that meet *TransPlan*'s definition of nodal development, *i.e.*, mixed use centers, Key Transit Corridors, and 20-minute neighborhoods. GIS, U.S. Census

% of dwelling units built in nodes	23.3%	26%	29%	32%	35%	% of new dwelling units built in areas that meet *TransPlan's* definition of nodal development, *i.e.*, % of new dwelling units built in mixed use centers, 20-Minute Neighborhoods, and along Key Transit Corridors. LCOG, Census
% of New "Total" Employment in Nodes (Per *TransPlan*, the calculation of the measure excludes employment that would not likely located in a nodal area, such as industrial employment.)	45%	48%	51%	54%	57%	% of new employment located within areas that meet *TransPlan*'s definition of nodal development, *i.e.*, % of new employment in mixed use centers, 20 Minute Neighborhoods, and along Key Transit Corridors. LCOG data

DATE: March 4, 2011

This memorandum describes and analyzes the current (2010) transportation system in Eugene, including existing conditions and deficiencies. The report evaluates the roadway network, public transportation routes and service, bicycle facilities, pedestrian facilities, rail facilities, airports, and pipelines within the project study area. This memorandum also describes general land use patterns and major activity centers that generate traffic. The information used to describe the existing system and identify deficiencies in this report came from the City of Eugene, Lane County, the Oregon Department of Transportation (ODOT), Lane Transit District (LTD) and from the consultant team through a site visit on July 27-28, 2010.

While this document attempts to accurately reflect the existing conditions of the transportation system within Eugene, it is not meant to serve as an all-encompassing and comprehensive final assessment. Rather, the document is meant to serve as a starting point for discussion by the broader community, and will be used to help inform the development of the Eugene TSP (TSP). The memorandum is organized as follows:

Contents

List of Figures

List of Tables

List of Appendixes

Study Area

The study area for the Eugene TSP is largely comprised of the existing Eugene/Springfield Urban Growth Boundary (UGB) west of Interstate 5, and extends to include the Eugene Airport. The study area is illustrated in Figure 1. In addition, the existing conditions analysis considers areas outside the direct study area (e.g., the City of Springfield, the City of Coburg) to the extent that they affect travel patterns and transportation-related needs for the City of Eugene.

Land Use

The City of Eugene's zoning code identifies the types of development and land uses that are currently allowed within a designated area. The City's comprehensive plan provides a long-term vision for growth in the area and guides policy decisions within a city. The City of Eugene is currently updating its comprehensive plan through the *Envision Eugene* process (underway).

Metropolitan areas in Oregon are required to develop a regional transportation system plan. *TransPlan*, the current regional and local TSP adopted in 2001 (amended in 2002), introduced land use policies to create mixed-use development areas. These areas would have a mixture of land uses, supporting the use of alternative modes of transportation.

Figure 2 displays the land use designations outlined in the Eugene-Springfield's Metropolitan Area General Plan (Metro Plan), the current comprehensive plan for the Eugene-Springfield metro area and Figure 3 displays the current zoning throughout the study area. Figures 4a-4e display the potential mixed-use development areas identified in *TransPlan.*

General Overview of Existing Land Use

This section provides a general overview of existing and allowed land uses in the City of Eugene. It is intended not to be comprehensive but to inform the TSP team in identifying how current land uses affect current transportation conditions. For this effort, the City of Eugene was divided into five (5) geographic areas. The current zoning designations and land use patterns were reviewed, as well as activity areas identified, within the study area. Land use patterns are compared with the zoning code to identify areas where higher than expected traffic volumes or different traffic patterns may occur. The rest of this section is organized by the following five areas (shown in Figures 4a-4e):

- **Central Eugene:** This area comprises the central business district and inner Eugene neighborhoods. It is bounded by the Willamette River to the north, Laurel Hill Valley to the east, the south hills to the south, and Chambers St. to the west.
- **South Hills:** This area comprises the hills rising up to the south and east of Eugene.
- **West Eugene/Bethel/Danebo:** This area includes neighborhoods north of the West Eugene Wetlands and west of Chambers Street and Northwest Expressway.
- **NE Eugene – Willakenzie/Ferry Street Bridge:** This area is bounded by the Willamette River to the west and south, and by I-5/Springfield to the east.

- **River Road/Santa Clara:** This area is bounded by Northwest Expressway to the west and the Willamette River to the east.

These areas were initially developed for the Eugene Pedestrian and Bicycle Master Plan analysis (November 2010). They were used for the land use analysis for this planning effort as they follow general land use patterns throughout the city and establish consistency between transportation planning efforts.

Mixed Use Development Areas

TransPlan, the current regional and local TSP adopted in 2001 (amended in 2002), introduced a policy of nodal development in the Eugene/Springfield metropolitan area. The plan states that "nodal development supports mixed land uses in designated areas to increase opportunities for people to live near their jobs and to make shorter trips for a variety of purposes. Nodal development also supports the use of alternative modes of transportation."(Chapter 2, Land Use Policy #1) *TransPlan* identified fifty-three potential nodal areas (also known as Mixed Use Centers) in the Eugene-Springfield area, thirty-nine of which are located within Eugene.

Of the thirty-nine mixed use development areas in Eugene, seven were visited as part of the existing conditions land use analysis and are described in this section. These areas were chosen for the purposes of focusing the analysis on areas that have differing land uses and activity generation, and were selected in coordination with City of Eugene staff. Each mixed use development area will be described within the geographic area subsection in which it is located. These development areas are displayed on Figures 4a - 4e.

Activity Areas

Throughout Eugene there are several major destinations that attract people by personal vehicle, bicycle, and foot, and therefore, generate a significant amount of traffic. These uses attract both visitors from outside of Eugene and residents within Eugene. Major activity centers will be noted in the geographic area subsections and are also shown in Figures 4a – 4e. The list of activity areas presented in this section is not intended to be exhaustive but instead will provide an indication of many of the areas where activity occurs in the City of Eugene.

Central Eugene

Central Eugene is comprised of the central downtown area, the University of Oregon, and the surrounding neighborhoods (see Figure 4a). This area of the city serves as a center for many civic, commercial, and sporting activities within the City of Eugene and is zoned to accommodate these uses. The University had an enrollment of more than 22,000 in 2009. With eight residence hall complexes and five apartment/home communities for only about 4,100 students, most students and employees must commute to this area. Other major attractors within Central Eugene include City Hall (8th Avenue and Pearl Street), Lane Transit District's Eugene Station (10th Avenue and Willamette Street), Skinner Butte Park (along the Willamette River between Lincoln and High streets), and Hilyard Community Center/Amazon Community Center & Pool (Hilyard Street between 24th Avenue and 28th Avenue).

Central Eugene also hosts many events that attract regional attendance. Large sporting events for the University of Oregon are held in Central Eugene at Hayward Field (on the

University of Oregon campus), MacArthur Court (also on the University of Oregon campus), and Matthew Knight Arena (13th Avenue and Franklin Boulevard – opened December 2010) and cultural events are held at the Hult Center (7th Avenue and Willamette Street) and Lane County Fairgrounds (13th Avenue and Monroe Street). Other community events that occurred in the downtown core throughout 2010 summer included the Saturday Market crafts and food fair; a Tuesday, Thursday, and Saturday Farmer's Market; the Oregon Bach Festival; and many summer in the City events. Summer in the City is a series of outdoor events organized by the City and sponsored by community partners. 2010 Summer in the City events included the Eugene Celebration Raise the Roof; the KOOL 99.1 Dance Party & Theatre Teasers; No Shame Theatre; bicycle and walking breakfasts; and outdoor concerts.

The most common zoning designations within Central Eugene are low-, medium-, high-, and limited high-density residential; community and major commercial; and public land. This variety and the distribution of designations facilitate dense commercial and residential development in the downtown core area and residential development and parks throughout the remaining area. Land use throughout the Central Eugene area is primarily single- and multi-family residential, retail, services, offices, government, parks, and educational facilities. Other common uses include religious or non-profit uses and vacant land.

Central Eugene also contains six "special area" zones (SW Whiteaker Special Area zone, SF Fifth Avenue Special Area zone, S-DW Downtown Westside Special Area zone, S-JW Jefferson Westside Special Area zone, Riverfront Park Special Area zone, and S-HB Blair Boulevard Historic Commercial Special Area zone). These areas have special zoning requirements such as design requirements.

Land uses and zoning are generally in conformance with each other in the Central Eugene area. A few land uses were identified that may create higher traffic flows or different traffic patterns than would be expected with the uses that are normally occur within the designated zone. For example, multi-family housing was identified in a few locations zoned as major commercial. Although multi-family development is encouraged by city policy in this zone and allowed by the commercial zoning, these land uses may create different transportation system demands than commercial uses. Retail and service uses were also identified in areas zoned for industrial uses. These uses are allowed, with a conditional use permit, in an industrial zone but are noted as they may impact traffic patterns or volumes.

Visited Mixed Use Development Area #1 – 13th Avenue from Ferry to Kincaid

This area is located along 13th Avenue from Ferry Street to its terminus at the University of Oregon. The land uses within this area are primarily retail and service, although the development density and character varies throughout the area. The block between Alder and Kincaid streets provides a retail center that is friendly to pedestrians with wide sidewalks, pedestrian lighting and continuous storefronts. The volume of bicyclists and automobiles, coupled with a narrow street and

13th Avenue looking west.

parallel parking, create a less than optimal on-street environment. A number of University of Oregon related stores, including the University of Oregon bookstore, and businesses oriented towards University clientele are located on this block.

The other blocks in this mixed use development area are also primarily retail and service businesses. Between Ferry and Patterson streets, the development pattern is primarily low-density commercial, with many of the businesses being located in converted residential buildings. Sacred Heart Medical Center, University District is located on the corner of 13th Avenue and Hilyard Street. New construction was observed across the street from the hospital during a site visit.

This focus area is zoned for commercial uses and has a mix of low- to mid-density commercial, parking garages, medical related offices, and the hospital. Current land uses appear to be generally consistent with the designations in the 13th Avenue from Ferry to Kincaid focus area.

Visited Mixed Use Development Area #2 – Walnut Station

Walnut Station is located along Franklin Boulevard from Villard Street to Walnut Street and along Walnut Street from 15th Avenue to the Willamette River. This area is located adjacent to the Walnut Station EmX bus rapid transit (BRT) station and is zoned public land and commercial. The area currently has a mix of commercial uses (such as hotels/lodging, a grocery store, financial and automobile services, a convenience store, food service/restaurants, offices) and vacant buildings with large parking lots. The commercial establishments are focused along Franklin Boulevard. Two vacant buildings are located at the corner of Walnut Street and Franklin Boulevard. The parking lots for these buildings are currently used by the University of Oregon. Two hotels and an office building are located north of Franklin Boulevard along Walnut Street. The City of Eugene recently adopted a form-based code for the Walnut Station area to encourage transit and pedestrian activity through mixed use as this area is redeveloped. The form-based code provisions allow for a wide variety of uses in this zone. As a result, the majority of the existing uses there are consistent with those allowed by the new code provisions although the current density and intensity of development is much lower than envisioned.

Vacant car dealership being used as University of Oregon parking lot at Walnut Station node.

Woodfield Station on 29th Avenue, west of Willamette Street.

Visited Mixed Use Development Area #3 – Woodfield Station

Woodfield Station is located on the border of the Central Eugene and South Hills sectors at the intersection of 29th Avenue

and Willamette Street. This focus area extends 2 blocks to the west along 29th Avenue and provides a concentration of service and retail businesses in a portion of the City that is primarily residential in character. It is zoned for commercial development and includes commercial (such as food service/restaurants, financial and automobile services, grocery stores, and retail) and residential uses. The land uses in this focus area appear to conform to the current zoning.

Other activity Areas

In addition to the activity areas that characterize Central Eugene and the visited mixed use development areas, many other activity areas generate auto, pedestrian, and bicycle traffic. These other areas include:

- Amtrak Station (5th Avenue and Willamette Street)
- Eugene Downtown Public Library (10th Avenue and Olive Street)
- Greyhound Bus Terminal (10th Avenue and Pearl Street)
- PeaceHealth Medical Group - Downtown Eugene Clinic (11th Avenue and Willamette Street)
- South Eugene High School (19th Avenue between Amazon Parkway and Patterson Street)
- Westmoreland Community Center/ Arts and Technology Academy at Jefferson (Fillmore Street between 19th and 24th Avenues)
- Northwest Christian University (11th Avenue and Alder Street)
- 5th Street Market (5th Avenue between Pearl and High Streets)
- Sundance Market (24th Avenue and Hilyard Street)
- Albertsons and Bi-Mart (18th Avenue and Chambers)

South Hills

The South Hills area includes the hills to the south of Eugene (see Figure 4b). The character of the South Hills area is quite different from Central Eugene. This area is less commercial and has predominately low-density development and residential uses. In addition to single-family residential homes, other common uses within the South Hills include: multi-family residential; general services; religious or non-profit uses; recreation/parks; educational facilities; some agriculture; and vacant land. Agricultural zoned land within the study area is a remnant of previous county zoning and is a holding zone until development is proposed. This land is not designated as agricultural land, per the state definition related to buildable land supply, and can be urbanized.

The zoning designations and land uses in this area are generally in conformance with each other. The primary zoning designation within the South Hills is low-density residential. This concentration of single-family homes and the residential character of this area is consistent with the residential designation. Other prominent zoning designations include commercial; campus industrial; natural resource; agriculture; and public land. Campus industrial and natural resource lands are concentrated on the western border of this area.

In a few areas within the South Hills, existing land uses differ from the current zoning designations. For example, small areas exist that are zoned as medium- or high-density residential but are currently being used by services. Also, a portion of the campus industrial area is being used by services.

Single-family and multi-family residences are present on some areas within the study area zoned agriculture. Although one single-family dwelling is allowed per lot in this zone, these residential uses could result in higher levels of traffic than expected in these areas.

Other Activity Areas

Within the South Hills geographic area, Winston Churchill High School (18th Avenue and Bailey Hill Road) and Edgewood Center are areas that generate bicycle, pedestrian, and automobile traffic.

West Eugene/Bethel/Danebo

The West Eugene/Bethel/Danebo area (see Figure 4c) is primarily comprised of low-density development and open spaces. Low-density commercial development is located predominantly along major corridors throughout West Eugene/Bethel/Danebo and serve as attractors to the area. Some major shopping centers are concentrated along West 11th Avenue (Market Place West, Seneca Station-Fred Meyer and Lowe's, and WalMart/Target). Barger Crossing (the intersection of Barger Drive, Cubit Street, and Echo Hollow Road), Gilbert Center (Highway 99 and Fairfield Avenue) and Jerry's Home Improvement (Highway 99 north of Randy Papé Beltline) are other major attractors to the area.

When compared to the other geographic areas in Eugene, this area has some unique land use characteristics. For example, this area has more land used for industrial purposes than the other four Eugene geographic areas. Also, relative to the South Hills and River Road/Santa Clara areas, this area has greater amounts of land used for retail, service, and multi-family residential purposes. Although a wide variety of uses exist within this area, single-family homes are prevalent throughout a large portion of this area. Other common land uses within the West Eugene/Bethel/Danebo area include religious or non-profit uses; education; agriculture; park; and vacant land.

Shopping center on W 11th Avenue.

Zoning designations and land uses are generally in conformance in the West Eugene/Bethel/Danebo area. The six major designations within this area include: low-density residential; heavy, light medium, and campus industrial; commercial; and natural resources. Other designations with substantial land in this area include: medium-density residential; public land; and neighborhood commercial. Royal Node and Elmira Road special area zones are also located within West Eugene/Bethel/Danebo.

In a few select locations in the West Eugene/Bethel/Danebo area, land use patterns were identified that may result in different traffic patterns than would be expected from the

common uses allowed in the zoning code. Land use patterns noted for their potential to create traffic patterns different expected include: land zoned as industrial and used for retail, religious or non-profit organizations, or service purposes; multi-family residences on land zoned community commercial along Highway 99, services located on land that is zoned limited high-density residential and single-family residences on land zoned agriculture. Although these uses may be allowed outright or with a conditional use permit, their existence in these zones is noted as higher levels of traffic or different traffic patterns may occur.

Visited Mixed Use Development#4 – Royal West Shopping Center

Royal West Shopping Center is located at the intersection of Danebo Avenue and Royal Avenue and provides access to commercial businesses in a primarily residential neighborhood. The shopping center includes a grocery store, financial services, retail stores, food service/restaurants, and convenience stores. Both single-family and multi-family residential uses are located adjacent to the shopping center. The area is zoned for low- and medium-density residential as well as neighborhood and community commercial. The current land uses conform to these designations.

Figure 13: Albertsons at Royal West Shopping Center.

Other Activity Areas

In addition to the major shopping areas that are prevalent in West Eugene/Bethel/Danebo, this area contains some other areas that may generate automobile, bicycle, and pedestrian trips. Other activity areas within this subarea include the Peterson Barn Community Center (Royal Avenue and Berntzen Road) and Willamette High School/Echo Hollow Park & Pool/Cascade Middle School (Echo Hollow Road between Willhi Street and Dove Lane).

River Road/Santa Clara

The River Road/Santa Clara area of Eugene (see Figure 4d) consists primarily of low-density residential development, with services and retail uses along River Road. The concentration of services and retail at shopping centers along the River Road corridor, such as Riviera Center and Santa Clara Square, makes it a major attractor within the area. The River Road/Santa Clara area is unique within the study area because a large amount of the land is located outside of the City of Eugene but inside the UGB. Concentrations of agricultural zoning are also located north of Randy Papé Beltline and outside of the City boundary but inside of the UGB. Land uses appear to generally follow zoning designations in the River Road/Santa Clara area.

Santa Clara neighborhood.

Other Activity Areas

The River Road/Santa Clara area of Eugene also contains North Eugene High School (River Road between Silver Lane and Kourt Drive), which serves as an activity area and generates bicycle, pedestrian and automobile traffic.

Northeast Eugene – Willakenzie/Ferry Street Bridge

Autzen Stadium.

Northeast Eugene (Figure 4e) has a wide variety of land uses and major attractors. Alton Baker Park, Autzen Stadium, and PK Park are located along the Willamette River and at the southern border of the area. Autzen Stadium is a major attractor during University of Oregon football game days and PK Park is visited for the University of Oregon and Eugene Emeralds baseball games. Alton Baker Park is a major attractor as the Science Factory Children's Museum and Planetarium, Cuthbert Amphitheater and two boat ramps are located within its boundaries. One boat ramp is located west of the Autzen Pedestrian and Bicycle Bridge while the other ramp is located in the far eastern portion of the park. Northeast Eugene also has concentrations of service and retail businesses along Coburg Road, Green Acres Road/Crescent Avenue, and Valley River Drive. Major shopping centers along these roads, such as Delta Oaks Center, Valley River Center, and Oakway Center serve as attractors to Northeast Eugene.

Residential neighborhoods are located adjacent to these major corridors and shopping attractors. Many of these neighborhoods are primarily single-family homes while some have concentrations of multi-family residences. Other frequent land uses in the area include: education, religious or non-profit uses; and utilities. Agricultural uses also occur in multiple large areas north of Randy Papé Beltline Highway.

The land uses found in Northeast Eugene generally conform to the zoning designations in this portion of the study area. A large portion of Northeast Eugene is zoned for low-density residential uses but the area also has concentrations of medium-density and high-density residential; commercial; general office; campus industrial; agriculture; and public land. The areas zoned agriculture are located near the edge of the study area and are likely remnants of county zoning. The commercial and higher density residential, are often concentrated in areas or along corridors creating higher activity locations, such as the commercial shopping centers along Coburg Road. A concentration of high-density residential zoning also exists south of I-105, adjacent to the Chase Node Special Area zone.

Visited Mixed Use Development Area #5 – Crescent Village

Crescent Village is located in the area east of the intersection of Coburg Road and Crescent Avenue. A variety of land uses are present in this development area creating a mixed-use center with commercial businesses (such as food service/restaurants, convenience businesses, medical services, grocery stores, retail, and offices) and residential buildings. A large exercise facility is located directly west of this node.

Within the development area, residential uses are concentrated east of Shadowview Drive and north of Crescent Avenue and in some portions of the area south of Crescent Avenue. A mixed use development has recently been constructed along Shadowview Drive north of Crescent Avenue This area has a main street where buildings have space for ground floor retail and apartments and offices above. This main street also accommodates on street parking and off-street parking is located behind the buildings. The area south of Crescent Avenue has multi-family residential complexes and areas with low-density commercial uses .

Multi-family housing at Crescent Village.

In the newly constructed main street area, along Shadowview Drive, more walking or bicycle trips will likely occur as the uses are very integrated in that portion of the Crescent Village. In the other portion of the area, individuals may still need to drive between uses as the uses are separated and commercial buildings follow a low-density pattern. This development area is zoned for low, medium and high-density residential, community and neighborhood commercial, general office, and campus industrial uses. Current land uses generally conform with these designations.

Visited Mixed Use Development #6 – Chase Gardens

Chase Gardens is located in the area north of the Garden Way - Martin Luther King Jr. Boulevard intersection. This development area includes medical office complexes with substantial parking lots, multi-family housing, an unimproved park, undeveloped commercial properties, and undeveloped open space along the Q street Channel. Some assisted living facilities are located in this area as well as housing used mostly by university students. Along Commons Drive is a small convenience market and other retail, as well as a restaurant.

Multi-family housing at the Chase Gardens node.

The development within this area is all relatively new construction and follows the requirements outlined in the Chase Node Special Area zoning code. The purpose of this zone is to facilitate the implementation of nodal development in this area and identifies specific design requirements to meet these goals. However, the introduction of significant medical facilities within the commercial area, rather than more neighborhood-serving businesses, may contribute to more destination automobile trips to the area than originally planned.

Autzen Stadium is also located close to this area as well as off-street bicycle and pedestrian connections to the University of Oregon. These facilities have made it attractive for both students and the elderly to reside in the area.

Visited Mixed Use Development #7 – Oakway Center

Oakway Center is located at the intersection of Coburg and Oakway roads. This shopping center includes a grocery store and a variety of retail stores. Pedestrian friendly elements, such as storefront awnings and raised crosswalks, are located throughout the shopping center. The uses within the center are consistent with the community commercial zoning designation.

Retail stores at Oakway Center.

Other Activity Areas

Northeast Eugene contains the Sheldon Branch Library, the Sheldon Community Center, the Sheldon Park Pool, and Henry D. Sheldon High School (all located along Coburg Road between Young and Jeppsen Acres Roads). For analysis purposes this is considered as one general activity area. Costco, located at Chad Drive and Coburg Road, is another activity area within Northeast Eugene.

Demographic Analysis

As of the 2000 US Decennial Census (2000 Census), total population within Eugene was 137,231 persons, with an average household size of 2.27 people. Portland State University's Population Research Center, which serves as the State's Census office, estimates Eugene's 2009 population as 157,100 persons as of July 2009.

The American Community Survey is conducted by the U.S. Census Bureau to collect more timely demographic information than the decennial Census. This survey is used for the demographic analysis as it produces the best available data. Table 1 provides a snapshot of demographic statistics, based on the 2008 American Community Survey.

The American Community Survey shows that in 2008, the percentage of individuals in the labor force, percentage of individuals who speak a language other than English at home, and percent was higher in Eugene than in Lane County but lower than the State of Oregon. This data also shows that a lower percentage of individuals aged 65 years or older reside in the City of Eugene than Lane County but a higher percentage than in the State of Oregon. The 2008 ACS also shows that the percentage of individuals below the poverty line was higher in the City of Eugene than in Lane County or the State of Oregon.

TABLE 1
Select 2008 American Community Survey Demographic Characteristics for Eugene, OR

Demographic Characteristics	Percent of Total Population (%)		
	City of Eugene	Lane County	Oregon
In labor force (population 16 years and over)	64.3	63.5	65.3
Persons aged 65 years and older	13.8	14.5	13.3
Speak a language other than English at home	12.4	10.1	14.0

TABLE 1
Select 2008 American Community Survey Demographic Characteristics for Eugene, OR

Demographic Characteristics	Percent of Total Population (%)		
	City of Eugene	Lane County	Oregon
Individuals below poverty level	20.8	15.8	13.6
Minority population	17.1	14.4	20.1

Source: 2008 American Community Survey, US Census Bureau

Rates of individuals with the presence of physical disabilities were not released from the 2008 American Community Survey. The 2000 Census provides the best available demographic data about this population. In 2000, 16.4% of the population in the City of Eugene had the presence of a disability. This rate was lower than rate in Lane County (19.0%) and Oregon (18.8%).

Commute and Mode Characteristics

Data from the American Community Survey was used to identify commute and mode split characteristics. Data for the City of Eugene was compared to findings for the City of Salem, Portland, and Bellingham, Washington to provide a comparison between similar cities. The City of Portland was chosen for comparison as it is another major city in Oregon and with similar alternative transportation values as Eugene. Salem was chosen as it has a similar size population as Eugene. Bellingham, Washington was also chosen for comparison as it has a significant university population. Although Bellingham is smaller than Eugene, it was determined that comparing their commuting patterns would provide valuable information.

Mean travel time to work can be used as an indicator for congestion levels and land use patterns. The 2006-2008 American Community Survey provides the best available data about mean travel time for each of these cities. This data shows that the mean travel time to work in the City of Eugene was 16.9 minutes. This is lower than the mean travel time to work of residents in the City of Portland (24.1 minutes), the City of Salem (22.3 minutes) and, and the City of Bellingham (17.5 minutes).

According to the 2008 American Community Survey, the primary mode choice for commuting in the City of Eugene was the single occupancy vehicle (64.4 percent), with 9.5 percent carpooling, 7.1 percent using public transportation, 7.2 walking, and 8.7 using a taxicab, motorcycle, bicycle, or other means[1] percent bicycling, and 6.1 percent walking (Table 2). The percentage of commuters walking to work was higher in the City of Eugene than in the City of Salem, Portland, and Bellingham. The single occupancy vehicle and carpool rates were lower within the City of Eugene than in Salem, Oregon and Bellingham, Washington but, when compared to the City of Portland, was higher in both of these categories. The rate of individuals using public transportation to travel to work was higher in the City of Eugene than the City of Salem, almost equal to the City of Bellingham, and

[1] The 2008 ACS provides data on the use of taxicabs, motorcycles, bicycles , and other means as a single category for all of the cities in the table other than the City of Portland. For the City of Portland individual statistics are provided for each of these mode choices.

lower than the City of Portland. The large student population within the City of Eugene likely facilitates the high rates of alternative transportation use.

TABLE 2
2008 American Community Survey Commute Mode Split for Eugene, OR

Mode Choice	Percent of Total Population (%)			
	City of Eugene	Salem, OR	Portland, OR	Bellingham, WA
Single Occupancy Vehicle	64.4	75.0	60.5	65.9
Carpool	9.5	11.2	8.4	10.8
Public Transportation	7.1	3.8	12.6	7.2
Walked	7.2	3.0	5.3	6.6
Taxicab, motorcycle, bicycle, or other means	8.7	2.5	6.8	4.9

Policy Context

This section provides an overview of federal, state, regional, and local documents that comprise the policy framework for transportation planning in the City of Eugene. A variety of documents were reviewed to identify policies most relevant to the Eugene Transportation System Plan. Although each document reviewed contains many policies, only the policies and information most pertinent to development of the TSP are summarized to help focus this work. New policies considered for inclusion in the Eugene TSP are expected to be consistent with the currently adopted policies reviewed here. The following documents were reviewed for policies and regulations applicable to the city's TSP.

State/ODOT Plans, Policies and Relevant Documents

- Oregon Land Use Planning Goals
- Transportation Planning Rule (OAR 660-12)
- Oregon Transportation Plan
- Oregon Highway Plan
- Oregon Bicycle and Pedestrian Plan
- Oregon Public Transportation Plan
- Access Management Rule (OAR 734-051)
- Freight Moves the Oregon Economy
- ODOT Highway Design Manual
- State Transportation Improvement Program (STIP)
- Oregon Rail Plan

- Oregon Aviation Plan
- Oregon Transportation Safety Action Plan
- Governor's Executive Orders

Regional Plans, Policies and Relevant Documents

- Lane County TSP
- Eugene-Springfield Metropolitan Area General Plan (Metro Plan)
- TransPlan
- Central Lane Metropolitan Planning Organization Regional Transportation Plan
- Lane Transit District Capital Improvements Program

Local Plans, Policies and Relevant Documents

- Eugene Land Use Code
- Eugene Growth Management Policies
- Central Area Transportation Study
- Eugene Pedestrian & Bicycle Strategic Plan
- Eugene Arterial and Collector Street Plan
- Eugene Parking Analysis, Final Report
- Eugene Capital Improvements Program
- West Eugene Collaborative Recommendations

Statewide Plans, Policies and Relevant Documents

Statewide Planning Goals

Statewide Planning Goal 1: Citizen Involvement

Goal 1, Citizen Involvement, requires that jurisdictions develop, adopt, and update comprehensive plans to provide the "opportunity for citizens to be involved in all phases of the planning process." According to the goal, the planning process includes the preparation of plans and implementation measures, plan and implementation measure adoption, and minor and major amendments to adopted plans. Technical information associated with the planning process must be available to citizens in an understandable form, and accessible ways of providing feedback must also be available.

Development of the Eugene TSP will need to be consistent with the citizen involvement goal. As part of the public involvement element, Eugene and ODOT will identify individuals to serve on one of two advisory boards – a Technical Advisory Committee (TAC) or a Department Advisory Committee (DAC). The TAC will consist of informed agency stakeholders who will provide technical input at key milestones during the TSP development process. The DAC will consist of business owners, residents, and community leaders who will provide advice to the project team at key milestones. Public open houses,

briefings, and/or other meetings will also be held at key points to keep the community informed and provide an opportunity for input. Stakeholder interviews will also be conducted and information about the project will be available on a project website. The official adoption process for the TSP will also require public notification and hearings before the Planning Commission and City Council. Those hearings provide opportunities for citizens to give written and oral comments that become part of the record.

Statewide Planning Goal 2: Land Use Planning

Goal 2, Land Use Planning, requires that a land use planning process and policy framework be established as a basis for all decisions and actions relating to the use of land. Goal 2 emphasizes the importance of planning coordination between those local governments and state agencies "which have programs, land ownerships, or responsibilities within the area included in the plan." In the case of the Eugene TSP, Goal 2 requires coordination between the cities of Eugene and Springfield, Lane County, LCOG, Lane Transit District (LTD) and ODOT; each have land use planning and transportation facility or service responsibilities in the planning area.

Statewide Planning Goal 5: Natural Resources, Scenic and Historic Areas, and Open Spaces

The purpose of Goal 5, Natural Resources, Scenic and Historic Areas, and Open Spaces, is to "protect natural resources and conserve scenic and historic areas and open spaces." This goal requires local governments to inventory natural and cultural resources in their jurisdictions and to develop and adopt programs to conserve and protect them. Amongst the resources to be inventoried are: riparian corridors, wetlands, federal Wild and Scenic Rivers, state Scenic Waterways, groundwater resources, wildlife habitat (e.g. upland habitat in addition to riparian habitat), natural areas, wilderness areas, open spaces, scenic views and sites, mineral and aggregate resource areas, energy sources, and historic and cultural areas. Techniques for implementing conservation and protection of these resources include fee acquisition, development rights acquisition, easements, preferential tax assessment, clustered development and other land use regulations.

Within the Eugene TSP planning area, there are some identified Goal 5 (and Goal 6, see below) resources, the most significant of which are the riparian areas surrounding the Willamette River. Goal 15 addresses the Willamette River Greenway in more detail and is reviewed in a subsequent section of this memorandum.

Statewide Planning Goal 6: Air, Water and Land Resources Quality

Jurisdictions must comply with state and federal environmental regulations. Goal 6, Air, Water and Land Resources Quality, calls for jurisdictions to "maintain and improve the quality of the air, water and land resources of the state." Waste and process discharges within a jurisdiction may not exceed the carrying capacity of the local air shed and water shed in the long-term, nor degrade the quality or otherwise threaten the availability of the air shed and water shed services.

Water resources, including the Willamette and McKenzie rivers and the metropolitan network of waterways and associated creeks and drainage ways are important features in the Eugene-Springfield metropolitan area and have the potential to be impacted by transportation decisions. This goal and corresponding policies in the area's comprehensive

plan (Metro Plan) must be taken into account in developing and selecting preferred alternatives and implementation measures in the Eugene TSP.

Statewide Planning Goal 7: Areas Subject to Natural Hazards

Goal 7, Areas Subject to Natural Hazards, was adopted to "protect people and property from natural hazards." The goal requires local jurisdictions to adopt comprehensive plans, including inventories, policies, and implementation measures, for identifying natural hazard areas and prohibiting or limiting development in these areas. Although local jurisdictions may define others, the goal defines natural hazard areas as those subject to floods, tsunamis, landslides, coastal erosion, earthquakes and related activities, and wildfires.

Similar to Goal 5 resources, natural hazards in the planning area will need to be considered as part of the TSP development process. In the city of Eugene, stream flooding and steep slopes constitute the primary natural hazards.

Statewide Planning Goal 8: Recreational Needs

Goal 8, Recreational Needs, was adopted to "satisfy the recreational needs of the citizens of the state and visitors, where appropriate, to provide for the siting of necessary recreational facilities including destination resorts." The goal requires that local government conduct comprehensive recreational planning by identifying recreational needs, planning for facilities in sufficient quantities and locations to meet these needs, and working with private companies and other partners in meeting these needs. This goal will apply to the Eugene TSP insofar as multi-use trails and other paths function as both transportation facilities and recreational opportunities.

Statewide Planning Goal 9: Economic Development

The intent of Goal 9, Economic Development, is to "provide adequate opportunities throughout the state for a variety of economic activities vital to the health, welfare, and prosperity of Oregon's citizens." Local comprehensive plans and policies must support this goal and should include an assessment of the jurisdiction's existing economic conditions and comparative advantages. Plans should also include policies that address economic development and development opportunities, provide an adequate supply of sites with characteristics suitable for a variety of employment and economic development, and limit development around identified industrial sites to that which is compatible with uses allowed on the sites. The goal suggests implementation measures such as tax incentives and disincentives, preferential assessments, land use regulations, capital improvement planning and programming, and fee or partial fee acquisition.

The Eugene TSP must demonstrate the ways in which the preferred alternatives and projects selected for the TSP support this goal and the economic development policies adopted in the city's comprehensive plan.

Statewide Planning Goal 10: Housing

Goal 10, Housing, forms the basis for requiring a 20-year supply of land for housing – among other uses – within a city's or metropolitan planning organization's Urban Growth Boundary (UGB). The goal states that "plans shall encourage the availability of adequate numbers of needed housing units at price ranges and rent levels which are commensurate with the financial capabilities of Oregon households and allow for flexibility of housing location, type and density." Any areas where increased housing density is planned within the existing UGB through either re-designations of lands or new regulations must have adequate transportation facilities, consistent with Goal 12. UGB expansions intended to provide sufficient amounts and types of housing must be coordinated with transportation planning; this relationship is also addressed by Goal 11, Public Facilities.

Statewide Planning Goal 11: Public Facilities

Public facilities that are named in Statewide Planning Goal 11 include water, sewer, solid waste, and transportation facilities. Goal 11 requires the preparation of public facility plans for jurisdictions with populations greater 2,500. The public facility plan or plans are supporting documents to the jurisdiction's comprehensive plan. As such, a TSP effectively serves as a jurisdiction's public facility plan for transportation, although a TSP becomes an element of the comprehensive plan, not just a supporting document.

Transportation system planning is addressed further by Statewide Planning Goal 12 and the Transportation Planning Rule (TPR, described in the following section). However, Goal 11 is important because it calls for coordination between various public facility providers and between state agencies and jurisdictions to establish funding for water, sewer, solid waste, and transportation facility planning and development. The goal also highlights the importance of not using public facilities to inappropriately or prematurely urbanize an area or allowing public facilities to influence planning for the density and types of development.

Statewide Planning Goal 12: Transportation

Statewide Planning Goal 12, Transportation, requires cities, counties, metropolitan planning organizations, and ODOT to provide and encourage a safe, convenient, and economic transportation system. This is accomplished through development of transportation system plans based on inventories of local, regional, and state transportation needs.

Goal 12 is implemented through OAR 660, Division 12, the Transportation Planning Rule (TPR). The TPR contains numerous requirements that regulate transportation planning and project development. Of particular relevance to the Eugene TSP are sections 660-012-0020 through -0045. Those sections establish the requirement for all jurisdictions to prepare a Transportation System Plan, outline elements that must be included in the Transportation System Plan, and provide guidance for implementation of a Transportation System Plan. The TPR requires local governments to adopt land use regulations consistent with state and federal requirements "to protect transportation facilities, corridors and sites for their identified functions." This policy is achieved through a variety of measures, including:

- Access control measures that are consistent with the functional classification of roads and consistent with limiting development on rural lands to rural uses and densities;
- Standards to protect future operations of roads;

- A process for coordinated review of future land use decisions affecting transportation facilities, corridors or sites;
- A process to apply conditions to development proposals in order to minimize impacts and protect transportation facilities, corridors or sites;
- Regulations to provide notice to ODOT of land use applications that require public hearings, involve land divisions, or affect private access to roads; and
- Regulations assuring that amendments to land use designations, densities and design standards are consistent with the functions, capacities and performance standards of facilities identified in the Transportation System Plan. (See also OAR 660-012-0060.)

Prior to adoption, Eugene's TSP and land use code will be reviewed for consistency with the TPR and the state's access management requirements.

Statewide Planning Goal 13: Energy Conservation

The objective of Goal 13 is to conserve energy. This goal requires land and land uses to "be managed and controlled so as to maximize the conservation of all forms of energy, based upon sound economic principles." While land use planning can support transportation alternatives and measures to conserve energy, provisions for viable transportation alternatives and energy-conserving measures must also be included in the city's Transportation System Plan.

Statewide Planning Goal 14: Urbanization

Goal 14 regulates urban growth boundaries. The goal requires that establishment and change of a UGB shall be based upon, in part, consideration of the following four factors:

- Efficient accommodation of identified land needs;
- Orderly and economic provision of public facilities and services;
- Comparative environmental, energy, economic, and social consequences;
- Compatibility of the proposed urban uses with nearby agricultural and forest activities occurring on farm and forest land outside the UGB.

The orderly and economic provision of transportation facilities in cities is regulated largely by the TPR, which is summarized in a subsequent section of this memorandum.

Statewide Planning Goal 15: Willamette River Greenway

Goal 15 serves to "protect, conserve, enhance and maintain the natural, scenic, historical, agricultural, economic and recreational qualities of lands along the Willamette River as the Willamette River Greenway." The Greenway Program is composed of coordinated state and local plans for protection of the resource through ordinances, rules, regulations, permits, grants as well as acquisition and development of property. This goal requires an inventory of resources, uses and rights associated with the river in order to determine which lands are suitable or necessary for inclusion into the Greenway Program. The goal also establishes implementation measures that must be included in local plans and regulations to ensure a balance of appropriate uses within the Greenway. Cities and counties in which the Greenway is located must show the location and boundaries of the Greenway on their comprehensive plans. The Metro Plan (Eugene's comprehensive plan, reviewed in a subsequent section of this memorandum) shows the Greenway locations within the Eugene-

Springfield area. The Eugene TSP process will need to consider potential impacts to the Greenway when evaluating alternatives and policies.

Transportation Planning Rule (OAR 660-012) (Amended through 2006)

The TPR implements Oregon Statewide Planning Goal 12, which supports transportation facilities and systems that are safe, efficient, and cost-effective and are designed to reduce automobile reliance. The objective of the TPR is to reduce air pollution, congestion, and other livability problems, and to maximize investments made in the transportation system. Specific provisions of the rules are described in the following sections. Eugene's new TSP will need to be consistent with all of these provisions.

660-012-0015 Preparation and Coordination of Transportation System Plans

This section of the TPR establishes the requirement for MPOs and cities to prepare transportation system plans within their planning jurisdiction and to adopt the TSP as an element of their comprehensive plan. This section also requires that development of the TSP be coordinated with affected state and federal agencies, local governments, special districts, and private providers of transportation services

660-012-0016 Coordination with Federally-Required Regional Transportation Plans in Metropolitan Areas

Section -0016 requires that local governments prepare, adopt, amend and update transportation system plans in coordination with regional transportation plans prepared by MPOs. When an MPO adopts or amends a regional transportation plan, the affected local governments must review the regional plan and either make findings that the regional plan is consistent with the local plan or adopt amendments to the local plan to make them consistent.

660-012-0020 – Elements of Transportation System Plans

All jurisdictions in Oregon must prepare a TSP unless, for areas of small population, exempted by the Director of the Department of Land Conservation and Development (DLCD). Section –0020 of the TPR specifies what is required in a TSP including the following elements:

- Inventory and assessment of existing conditions
- Forecasts of transportation needs
- Road system plan
- Public transportation plan
- Bicycle and pedestrian plan
- Air, rail, water, and pipeline plans as applicable
- Transportation system and demand management plans
- A parking plan
- Financing program
- Implementing policies and land use regulations.

660-012-0025 Complying with the Goals in Preparing Transportation System Plans

The primary relevance of this section is that it requires that findings of compliance with applicable statewide planning goals and acknowledged comprehensive plan policies and land use regulations be developed in conjunction with the adoption of a transportation system plan.

660-012-0030 Determination of Transportation Needs

Section -0030 requires that transportation system plans be developed based on an identification of transportation needs. The determination of transportation needs must be based on population and employment forecasts and distributions and must consider adopted measures to reduce reliance on the automobile.

660-012-0035 – Evaluation and Selection of Transportation System Alternatives.

Section –0035 describes standards and alternatives available to agencies weighing and selecting transportation projects, including benefits to different modes, land use alternatives, and environmental and economic impacts. For MPOs, the RTP emphasizes alternatives that increase transportation choices and reduce reliance on the automobile. The most critical piece of this section is that it requires that the analysis be based on alternatives that can "reasonably be expected to meet the identified transportation needs in a safe manner and at a reasonable cost with available technology." The following elements must be evaluated as components of systems alternatives:

- Improvements to existing facilities or services;
- New facilities and services, including different modes or combinations of modes that could reasonably meet identified transportation needs;
- Transportation system management measures;
- Demand management measures; and
- A no-build system alternative required by the National

Metropolitan areas may also accomplish compliance with this section by demonstrating to that adopted plans and measures are likely to achieve a five percent reduction in VMT per capita over the 20-year planning period.

660-012-0040 Transportation Financing Program

Section -0040 requires that areas within a UGB containing a population greater than 2,500 persons include a transportation financing program as part of the transportation system plan. The financing program must include a list of planned transportation facilities and improvements, a general estimate of timing and cost for planned projects, and policies to guide selection of projects for funding.

660-012-0045 – Implementation of the Transportation System Plan

The TPR requires local governments to adopt land use regulations consistent with state and federal requirements "to protect transportation facilities, corridors and sites for their identified functions." This policy is achieved through a variety of measures described in this section.

660-012-0050 – Transportation Project Development

Section –0050 requires that transportation projects be reviewed for compliance with local and regional plans and, when applicable, undergo a NEPA environmental review process.

660-012-0060 – Plan and Land Use Regulation Amendments

Amendments made to Section –0060 in 2005 are among the most significant changes that have been made to the TPR since preparation of TransPlan. The amendments instruct local jurisdictions in how to determine whether an amendment to its adopted plans or land use regulations has a significant affect on a transportation facility.

Section –0060 specifies a category of facilities, improvements, and services that can be assumed to be "in-place" or committed and available to provide transportation capacity over a 20-year planning horizon. The TPR guides local jurisdictions in determining what transportation improvements are "reasonably likely to be provided by the end of the planning period" when considering amendments to local plans and land use regulations.

Oregon Transportation Plan (2006)

The Oregon Transportation Plan (OTP) serves as the TSP for the state. It is a policy document developed by ODOT in response to federal and state mandates for systematic planning for the future of Oregon's transportation system. The OTP is intended to meet statutory requirements (ORS 184.618(1)) to develop a state transportation policy and comprehensive long-range plan for a multi-modal transportation system that addresses economic efficiency, orderly economic development, safety, and environmental quality. The 2006 OTP emphasizes maintaining assets[2] in place, optimizing existing system performance through technology and better system integration, creating sustainable funding, and investing in strategic capacity enhancements.

The OTP's goals, policies and strategies guide the development of state multimodal, modal/topic[3] and facility plans and regional and local transportation system plans. The OTP provides the framework for prioritizing transportation improvements and funding, but it does not identify specific projects for development.[4] As required by Oregon and federal statutes, the OTP guides development and investment in the transportation system through:

- Transportation goals and policies,
- Transportation investment scenarios and an implementation framework, and
- Key initiatives to implement the vision and policies.

[2] The OTP defines "asset management" as a "systematic process of maintaining, upgrading and operating physical assets cost-effectively. It combines engineering principles with sound business practices and economic theory, and it provides tools to facilitate a more organized, logical approach to decision-making. Asset management provides a framework for handling both short- and long-range planning."

[3] Modal or topic plans, as developed by ODOT and other state agencies, include plans for aviation, bicycle and pedestrian facilities, highways, marine ports and waterways, public transportation and rail.

[4] Projects are identified through facility plans and regional and local transportation system plans, and sometimes through modal plans.

The Implementation Framework section of the OTP describes the implementation process and how state multimodal, modal/topic plans, regional and local transportation system plans and master plans will further refine the OTP's broad policies and investment levels. The Eugene TSP will further OTP implementation by defining standards, instituting performance measures, and requiring that operational strategies be developed. As stated in the Implementation section of the OTP, requirements for regional and local Transportation System Plans are found in the Transportation Planning Rule (OAR 660-012). Regional and local Transportation System Plans must be consistent with the OTP, state multimodal, modal/topic and transportation facility plans. The modal elements of the OTP are airports, bicycle and pedestrian facilities, highways, pipelines, ports and waterways, public transportation and railroads.

1999 Oregon Highway Plan (amendments to 2010)

The Oregon Highway Plan (OHP) was created in 1999 and reaffirmed as a modal element of the 2006 OTP. The OHP defines policies and investment strategies for Oregon's state highway system. The plan contains three elements: a vision element that describes the broad goal for how the highway system should look in 20 years; a policy element that contains goals, policies, and actions to be followed by state, regional, and local jurisdictions; and a system element that includes an analysis of needs, revenues, and performance measures. It does not include projects.

The OHP addresses the following issues:

- Efficient management of the system to increase safety, preserve the system, and extend its capacity
- Increased partnerships, particularly with regional and local governments
- Links between land use and transportation
- Access management
- Links with other transportation modes
- Environmental and scenic resources

The policy element contains several policies and actions that are relevant to the Eugene Transportation System Plan, described in the following subsections.

Under Goal 1: System Definition, the following policies are applicable:

Policy 1A (State Highway Classification System)

Action 1A.1 categorizes state highways for planning and management decisions.

Within the Eugene TSP planning area, there are several identified state highways, as shown on Figure 5.

- I-5 and I-105 are designated Interstate Highways. Interstate Highways provide connections to major cities, regions of the state, and other states. A secondary function in urban areas is to provide connections for regional trips within the metropolitan area. Interstate Highways are major freight routes and their objective is to provide mobility.

- Highways 126 and 569 are designated as Statewide Highways. Statewide Highways typically provide inter-urban and inter-regional mobility and provide connections to larger urban areas, ports, and major recreation areas that are not directly served by Interstate Highways. A secondary function is to provide connections for intra-urban and intra-regional trips.
- Highway 99 is designated as a Regional Highway. Regional Highways typically provide connections and links to regional centers, Statewide or interstate Highways, or economic or activity centers of regional significance. The management objective is to provide safe and efficient, high-speed, continuous-flow operation in rural areas and moderate to high-speed operations in urban and urbanizing areas.

The Eugene TSP will support the existing highway classifications and will enhance the ability of identified highways to serve in their defined functions.

Policy 1B (Land Use and Transportation)

Policy 1B, recognizes the need for coordination between state and local jurisdictions. Action 1B.7 gives special highway segment designations for specific types of land use patterns to foster compact development. The three segment designations available are Special Transportation Area, Commercial Center, and Urban Business Area. These designations may be considered in the Eugene TSP as solutions are developed.

Policy 1C (State Highway Freight System)

Policy 1C addresses the need to balance the movement of goods and services with other uses. In addition, Action 1C.4 states that the timeliness of freight movements should be considered when developing and implementing plans and projects on freight routes. Within the Eugene TSP planning area, the following roadways are designated as freight routes per the OHP:

- Interstate 5, from North UGB to South UGB
- Interstate 105/OR 126, from 6th Avenue/7th Avenue to Interstate 5
- Randy Papé Beltline, from W 11th Avenue to Interstate 5
- Oregon Route 126/ W 11th Avenue, from West UGB to Randy Papé Beltline
- Highway 99, from UGB to Randy Papé Beltline

The TSP will need to consider those designations and ensure consistency with the OHP policies on protecting the function of freight routes within the planning area.

Policy 1F (Highway Mobility Standards)

Policy 1F sets mobility standards for ensuring a reliable and acceptable level of mobility on the highway system. Action 1F.1 requires that highways operate at a certain level of mobility, depending on their location and classification. Part of this action also requires that freeway interchanges be managed to maintain safe and efficient operation of the freeway through the interchange area.

OHP Table 6 (located in Appendix A) contains a list of maximum volume to capacity ratios for peak hour operating conditions. For the highways identified in the Eugene MPO, the standard varies between 0.80 and 0.85, depending on the highway classification and whether or not the highway has a Freight Route designation. These mobility standards will serve as a gauge for determining traffic deficiencies both under current (2010) and future (2030) no build conditions.

Policy 1G (Major Improvements)

Policy 1G requires maintaining performance and improving safety by improving efficiency and management before adding capacity. Action 1G.1 directs agencies to make the fewest number of structural changes to a roadway system to address its identified needs and deficiencies through the 20-year planning horizon, and to protect the existing highway system before adding new facilities to it. The action ranks four priorities of projects, as follows:

- Preserving the functionality of the existing system
- Making minor improvements to improve the efficiency and capacity of the existing system
- Adding capacity to the existing system
- Building new transportation facilities

The intent of Action 1G.2 is to ensure that major improvement projects to state highway facilities have been through a planning process that involves coordination between state, regional, and local stakeholders and the public, and that there is substantial support for the proposed improvement.

Under Goal 2: System Management, the following policies are applicable:

Policy 2B (Off–System Improvements)

Policy 2B helps local jurisdictions adopt land use and access management policies. The Eugene TSP will include sections describing existing and future land use patterns, access management, and implementation measures.

Policy 2D (Public Involvement)

Public involvement in transportation and planning and project development will be a critical part of the TSP development process. A brief description of the public involvement process is provided under Statewide Planning Goal 1 in a previous section of this memorandum.

Policy 2F (Traffic Safety)

Policy 2F identifies the need for projects in the state to improve safety for all users of the state highway system through engineering, education, enforcement, and emergency services. One component of the Eugene TSP is identification of existing crash patterns and rates and strategies to address safety issues. Proposed improvements will aim to reduce the vehicle crash potential and/or improve bicycle and pedestrian safety by providing upgraded facilities that meet current standards.

Under Goal 3: Access Management, the following policy is applicable:

Policy 3A (Classification and Spacing Standards)

Policy 3A sets access spacing standards for driveways and approaches to the state highway system. Action 3A.1 directs access management along state highways based on access management guidelines. Action 3A.2 relates to establishing spacing standards on state highways. Action 3A.3 calls for management of location and spacing of traffic signals along state highways.

Under Goal 4: the following policies are applicable.

Policy 4B, Action 4B.4

Action 4B.4 requires that highway projects encourage the use of alternative passenger modes to reduce local trips.

The TSP will address ways to encourage the use of alternative passenger modes to reduce trips on highways and other facilities. This would include improvement to bicycle and pedestrian facilities and consideration of transit movement along roadways.

Oregon Bicycle and Pedestrian Plan (1995)

The Oregon Bicycle and Pedestrian Plan is a modal element of the Oregon Transportation Plan that provides guidance for planning, design and operation of facilities for bicycle and pedestrian travel. The plan contains the standards and designs used on state highway projects for these facilities.

The plan includes two parts: the Policy and Action Plan and the Planning, Design, Maintenance, and Safety section. The policy section provides background information, including relevant state and federal laws, and contains the goals, actions, and implementation strategies proposed by ODOT to improve bicycle and pedestrian transportation.

The plan states that bikeway and walkway systems will be established on rural highways by widening shoulders as part of modernization projects, as well as on many preservation overlays, where warranted. For urban highways, implementation may take place:

- As part of modernization projects (bike lanes and sidewalks will be included);
- As part of preservation projects, where minor upgrades can be made;
- By restriping roads with bike lanes;
- With minor betterment projects, such as completing short missing segments of sidewalks;
- As bikeway or walkway modernization projects;
- By developers as part of permit conditions, where warranted.

The second part ("Part Two") of the Oregon Bicycle and Pedestrian Plan governs the design of bicycle and pedestrian facilities on state-owned facilities. ODOT is currently updating the design section of the Oregon Bicycle and Pedestrian Plan. Many new pedestrian and bicycle treatments have been developed and incorporated into the update. Once adopted, the

updated Oregon Bicycle and Pedestrian Plan Design Standards and Guidelines will be referenced where bicycle or pedestrian facilities are planned as part of the Transportation System Plan. In addition, the city is preparing the Eugene Pedestrian and Bicycle Master Plan. This effort, now underway, will develop a network of recommended bicycle and pedestrian improvements within Eugene. This plan will serve as the basis for the Bicycle and Pedestrian element of the Eugene TSP and will need to be consistent with the Oregon Bicycle and Pedestrian Plan as well as relevant provisions of the TPR.

Oregon Public Transportation Plan (1997)

The Oregon Public Transportation Plan serves as the transit modal plan of the Oregon Transportation Plan. The vision guiding the Public Transportation Plan is as follows:

The public transportation plan builds on and begins implementing the OTP's long-range vision for public transportation in the State of Oregon. That vision includes:

- *A comprehensive, interconnected and dependable public transportation system, with stable funding, that provides access and mobility in and between communities of Oregon in a convenient, reliable, and safe manner that encourages people to ride*
- *A public transportation system that provides appropriate service in each area of the state, including service in urban areas that is an attractive alternative to the single-occupant vehicle, and high-quality, dependable service in suburban, rural, and frontier (remote) areas*
- *A system that enables those who do not drive to meet their daily needs*
- *A public transportation system that plays a critical role in improving the livability and economic prosperity for Oregonians.*

The plan contains goals, policies, and strategies relating to the whole of the state's public transportation system. The plan is intended to provide guidance for ODOT and public transportation agencies regarding the development of public transportation systems. The Eugene TSP will include a Transit Element that will need to be consistent with the goals and policies of the Oregon Public Transportation Plan. Coordination with the Lane Transit District will be necessary for development of the Transit Element.

Access Management Rule (OAR 734-051)

The intention of ODOT's Access Management Rule is to balance the safety and mobility needs of travelers along state highways with the access needs of property and business owners. ODOT's rule sets guidelines for managing access to the state's highway facilities in order to maintain highway function, operations, safety, and the preservation of public investment consistent with the policies of the 1999 OHP. Access management rules allow ODOT to control the issuing of permits for access to state highways, state highway rights of way and other properties under the state's jurisdiction.

In addition, the ability to close existing approaches, set spacing standards and establish a formal appeals process in relation to access issues is identified. These rules enable the state to set policy and direct location and spacing of intersections and approaches on state highways, ensuring the relevance of the functional classification system and preserving the efficient operation of state routes.

There are two categories of standards included in the Access Management Rule – those applicable in urban areas and those applicable in rural areas. ODOT applies the urban access standards for state highways within the Eugene UGB. These standards will be used in the TSP to analyze the current access conditions, determine existing deficiencies, and provide direction for establishing a connectivity plan. These standards will be applied to all rights-of-way under the state's jurisdiction in the City of Eugene.

Freight Moves the Oregon Economy (1999)

While not a policy document, this report is useful because it summarizes a variety of information about issues and needs surrounding the transport of freight by roads, rail lines, waterways, aircraft, and pipelines. The document's stated purpose is to demonstrate the importance of freight to the Oregon economy and identify concerns and needs regarding the maintenance and enhancement of current and future mobility within the state of Oregon.

The report describes the federal National Highway System (NHS), a classification system that identifies the most significant highways for moving people and freight. The report describes the State Highway Freight System as including all of the state's interstate highways and selected other highways important to moving freight. The importance of freight movement will be a consideration during the Eugene TSP development as it pertains to access to I-5 and other designated freight routes, and how the local roadway system intersects with rail operations. In addition, per ORS 366.215, anything that could potentially be considered a reduction of capacity on a designated freight route needs to be approved by the Freight Committee.

ODOT Highway Design Manual

This manual contains standards for the design of state highways and various highway elements. Elements such as general alignments, roadway widths, and criteria for installation of turn lanes will need to be considered for evaluating the feasibility of construction and determination of right of way needs for the Transportation System Plan.

Table 10-1 in the Highway Design Manual displays the maximum allowable volume to capacity ratios for the 30th highest annual hour of traffic for use in the design of highway projects. These standards are to be applied to conditions forecasted to exist 20 years after completion of the proposed improvement. If the applicable mobility standard cannot be met, a design exception could be sought.

Elements of alternatives developed that include the construction or modification of state facilities must be designed in accordance with the requirements of the Highway Design Manual. To ensure feasible construction of proposed alternatives, these design standards must be used when laying out roadway alignments, turn lanes, and other roadway elements. Also, the ability of proposed highway improvements to adequately accommodate future traffic demand will be evaluated through the use of the mobility standards from the Highway Design Manual, rather than those from the Oregon Highway Plan.

State Transportation Improvement Program (2008 - 2011)

The State Transportation Improvement Program (STIP) is the programming and funding document for transportation projects and programs statewide. The projects and programs undergo a selection process managed by ODOT Regions or ODOT central offices. The

document covers a period of four years and is updated every two years. The STIP contains a number of projects within the city of Eugene; the TSP will need to be consistent with projects that are included in the STIP and the Draft 2010-2013 STIP that is scheduled for adoption in 2010. Once the TSP is adopted, the STIP will be updated to provide consistency between the two documents. Appendix B contains a list of projects from the 2008 – 2011 STIP that are relevant to the Eugene Transportation System Plan.

Oregon Rail Plan (2001)

The Oregon Rail Plan serves as the Rail Element of the OTP and is a comprehensive assessment of the state's rail planning, freight rail, and passenger rail systems. The Plan contains three elements, which summarize the state's goals and objectives, measure the state's performance to-date and refines the projected costs, revenues and investment needs with regard to rail transportation of people and goods. The elements are:

- Rail Policies and the Planning Process
- Freight Element
- Passenger Element

The passenger element of the rail plan concentrates on intercity passenger service with some mention of commuter rail operations. It does not include light rail or other rail transit types. Figure 2-1 of the plan shows two types of rail lines within the Eugene TSP planning area: the Union Pacific line and the Central Oregon & Pacific (CORP) short line. The Union Pacific line has the highest density (Figure 2-2) with more than 20 million gross ton-miles in 1999 and the CORP line has lighter density with less than 5 million gross ton-miles. Figure 3-1 also indicates that the Amtrak passenger route passes through Eugene. According to ODOT's Rail Section, Eugene serves as the southern terminus of the designated Cascadia high speed rail corridor which would provide a speed and reliability upgrade between the cities of Eugene, Portland, Seattle, and Vancouver, B.C.

Oregon Aviation Plan (2010)

The Oregon Aviation Plan provides an overview of the airports in the state system and the jurisdictional responsibilities at all levels of government for the management, maintenance, operation, and funding of Oregon's airports. The Oregon Aviation Plan includes policies and investment strategies for airports in Oregon.

The Eugene Airport is designated as a Category 1 airport per the plan. Category 1 airports are commercial service airports that are designed to accommodate scheduled major/national or regional/commuter commercial air carrier service. For guiding growth and development of the Eugene Airport, the city relies primarily on the Eugene Airport Master Plan which is consistent with policies of the Oregon Aviation Plan. The Eugene Airport Master Plan was updated in 2010 and serves as a development guide for the Airport's short-term (5 to 10 years) and long term (20 year) needs. The Airport Master Plan presents a 20-year development plan that is "technically correct, environmentally sound, financially viable, and implementable; and identifies the overall land requirements that will ensure the Airport's long-term operational viability". The Master Plan will inform the airport element of the Eugene Transportation System Plan.

Oregon Transportation Safety Action Plan (2004 - 2006)

The Oregon Transportation Safety Action Plan is the safety element for the OTP. As an OTP plan element, it defines in greater detail system improvements, legislative needs, and financial needs to improve safety conditions on the state highway system. The plan states that the focal point for transportation safety programs in ODOT is the Transportation Safety Division (TSD). This division, with guidance from the Oregon Transportation Safety Committee, carries out most of the responsibilities established in ORS 802.310.

The plan documents changes that must occur by the year 2014 and the year 2024 that will result in a safer transportation system for Oregon. It includes 69 actions organized by the framework provided in the OTP. The 69 actions constitute Oregon's transportation safety agenda for the next 20 years. Nine of the actions are "Key Actions." Key actions respond to the factors that contribute to the most transportation-related deaths and injuries -- impaired driving, not using safety restraints, speed, and inexperience -- and were identified as actions that should be implemented by the year 2014.

One action in the Transportation Safety Action Plan that has direct relevance to the Eugene TSP process and the physical planning for transportation facilities in Eugene is Action 18, which emphasizes the role of access management in highway safety. Action 18 states that ODOT, as part of planning and project development, will continue to consider access management techniques that show significant improvements in safety for the roadway user, including the use of city and county roads as an alternative to increased access on state facilities.

Governor's Executive Orders

Executive Order No. EO 03-03: A Sustainable Oregon for the 21st Century.

Governor Kulongoski's executive order on sustainability states that economic recovery "will be aided by establishing a commitment to lasting solutions that simultaneously address economic, environmental and community well-being." It charges state government to "define sustainability, produce goals within state government to achieve sustainability, identify challenges to achieving sustainability and measure performance based on sustainability." While the sustainability order indirectly relates to transportation planning and implementation, it does not contain any action items that specifically target transportation. In keeping with the goals of the Oregon Sustainability Act adopted by the 2001 Legislature, the Eugene TSP should support this state initiative to move Oregon closer to a sustainable state.

Executive Order No. EO 00-23: Use of State Resources to Encourage the Development of Quality Communities.

Former Governor Kitzhaber signed an executive order on quality communities that communicates the state goal of accommodating growth and development in a manner that "promotes quality communities, protects the land base for our farm and forest industries, and reduces the cost of public facilities and services." This executive order acknowledges the necessity of coordinating state and local community development objectives. The directive is to ensure that state programs and activities help build and maintain quality communities, in part through development patterns that minimize public services costs and achieving a mix of land uses that support a balanced transportation system. The Quality

Development Objectives are intended to be used in "combination with state and local partnership principles and local development objectives to help build healthy and diverse communities and regions throughout Oregon." They relate to promoting compact development, a mix of uses, energy efficient development, including alternative modes and ensuring that development is compatible with community goals, environmental constraints, sustainability practices and goals to reduce commuting.

TSP policies and implementation measures should support and complement these objectives by promoting "quality development" within Eugene.

Regional Plans, Polices and Relevant Documents

Lane County TSP (2004)

The Lane County TSP is the 20-year transportation planning document for the county, serving as the transportation element of the county's Comprehensive Plan. The TSP establishes goals and policies for roads, bicycle and pedestrian facilities, public transportation, rail, air, water, and pipelines, land use and transportation, and financing and recommended improvements.

The plan also establishes functional classifications for county roads and standards for access management system performance (level of service) for county facilities, and refers to design standards that are specified in Lane Code Chapter 15.700. The plan recommends improvements, to be part of a 20-year project list and five-year Capital Improvement Programs, and financing for implementing the improvements.

The policies, regulations, and projects of the county TSP apply to county roads in Eugene or any parts of unincorporated areas within the Eugene-Springfield UGB. The Eugene TSP development process will need to be consistent with the policies of the Lane County TSP and coordinate with Lane County to address the planned projects listed in the county Transportation System Plan. Those projects are provided in Appendix C.

Eugene-Springfield Metropolitan Area General Plan (Metro Plan) (2004 – 2010)

The Metro Plan is the official long-range comprehensive plan for metropolitan Lane County and the cities of Eugene and Springfield. The Metro Plan sets forth general planning policies and land use allocations and serves as the basis for the coordinated development of programs concerning the use and conservation of physical resources, furtherance of assets, and development or redevelopment of the metropolitan area. The Metro Plan also identifies the major public facilities required to meet the land use needs designated within the urban growth boundary.

Chapter II of the Metro Plan contains the fundamental principles, goals and policies for growth management in the Eugene metropolitan area. Growth management policies emphasize the need to minimize urban sprawl through compact urban development within the urban growth boundary. This section of the plan also identifies the land use designations that will apply within the planning area. Land use designations provide direction for decisions pertaining to appropriate reuse (redevelopment), urbanization of vacant parcels, and additional use of underdeveloped parcels.

Chapter III of the Metro Plan contains goals and policies for specific planning elements such as housing, the economy and transportation. This section is most relevant to the Eugene TSP development process because it contains the specific goals and policies with which the Eugene TSP must be consistent. Those policies most pertinent to the TSP are summarized below. It should be noted that Eugene is in the process of preparing a new Comprehensive Plan which will supersede the Metro Plan and that the policies listed below may change as a result of that update.

Economic Element

- Policy B.18 is intended to encourage the development of transportation facilities that would improve access to industrial and commercial areas and improve freight movement capabilities.
- Policy B.19 states that local jurisdictions will encourage the allocation of funds to improve transportation access to key industrial sites or areas through capital budgets and priorities.

Environmental Element

- Policy C.22 states that the design of new street, highway, and transit facilities shall consider noise mitigation measures where appropriate.
- Policy D.11 requires that an exception must be taken if a non-water-dependent transportation facility requires placing of fill within the Willamette River Greenway setback.

Environmental Design Element

- Policy E.3 strongly encourages planting street trees, especially for all new developments and redeveloping areas (where feasible) and new streets and reconstruction of major arterials within the UGB.

Transportation Element

- TransPlan provides the basis for the surface transportation portions of the Metro Plan. The goals and policies in TransPlan are the same as those contained in this Transportation Element. Because TransPlan is reviewed and summarized in the next section, relevant goals and policies are not repeated here.

Energy Element

- Policy J.2 encourages careful control of energy related actions, such as automobile use, in order to minimize adverse air quality impacts. Trade-offs between air quality and energy actions shall be made with the best possible understanding of how one process affects the other.

Citizen Involvement Element

- Policy K.2 requires that the city maintain and adequately fund a variety of programs and procedures for encouraging and providing opportunities for citizen involvement in metropolitan area planning issues. Such programs should provide for widespread citizen involvement, effective communication, access to technical information, and feedback mechanisms from policymakers.

Eugene-Springfield TSP (TransPlan), 2002

TransPlan guides regional transportation system planning and development in the Eugene-Springfield metropolitan area. The plan includes provisions for "meeting the transportation demand of residents over a 20-year planning horizon while addressing transportation issues and making changes that can contribute to improvements in the region's quality of life and economic vitality." TransPlan establishes the framework upon which all public agencies can make consistent and coordinated planning decisions regarding transportation. The regional planning process ensures that the planning activities and investments of the local jurisdictions are coordinated in terms of intent, timing, and effect. TransPlan also serves as the transportation element of the Metro Plan and as the local TSP for both Eugene and for Springfield. The Lane Council of Governments is currently working to prepare an updated regional transportation plan.

TransPlan consists of two primary components: the policy element and implementation actions. The implementation actions were developed with the intent of providing flexibility to local jurisdictions in implementing the regional policies established in TransPlan.

Chapter 2 of TransPlan contains goals and policies for transportation growth and development in the metro region. Because these policies are directly relevant to development of the Eugene TSP and are too numerous to summarize here, a consolidated list of TransPlan policies is attached to this memorandum as Appendix D. Generally, those policies emphasize the creation of compact, mixed-use (nodal) development with quality bicycle and pedestrian connections and access to public transit.

Chapter 3 of TransPlan contains actions that implement the policy framework set forth in Chapter 2 and includes elements related to plan implementation that are required by state legislation. The first part of this chapter provides lists of capital investment actions for transportation system improvements in several categories: roadways, transit and bicycle projects. The projects on these lists are selected for inclusion in the Financially Constrained 20-Year Capital Investment Actions to establish a network of facilities that meet overall transportation needs for the 20-year planning period. These projects are too numerous to summarize here. The complete list of projects can be found at this website: http://www.lcog.org/documents/TransPlan/Jul-02/Chap%203.pdf.

Part two of Chapter 3 presents the Financial Plan which includes the following:

- A summary of the state regulations for financial constraint;
- A summary of future cost and revenue estimate methodologies;
- Forecasts of revenue from existing sources;
- An assessment of the revenue shortfall;
- A list of strategies to address the shortfall; and
- Development of the Constrained Plan.

Part four of Chapter 3 provides a range of regionally significant planning, administrative, and support actions that might be used to implement TransPlan policies. Local jurisdictions can use their discretion to evaluate and prioritize planning and program action

implementation. Recommended implementation actions are organized into the following categories:

- Land use
- Transportation demand management
- Transportation system improvements
  - System-Wide
  - Roadways
  - Transit
  - Bicycles
  - Pedestrian
  - Goods Movement
  - Other Modes

Central Lane Metropolitan Planning Organization Regional Transportation Plan (2007)

The Regional Transportation Plan (MPO RTP) guides the planning and development of the transportation system within the Central Lane Transportation Management Area. The federally-required MPO RTP includes provisions for meeting the transportation demand of residents over at least a 20-year planning horizon while addressing transportation issues and making changes that can contribute to improvements in the region's quality of life and economic vitality. It includes consideration of all transportation modes: roadways, transit, bikeways and pedestrian circulation, as well as freight movement and regional aspects of air, rail and inter-city bus service.

Previously, TransPlan (reviewed above) served as both the federally-required Regional Transportation Plan and the state-required local TSP for Eugene/Springfield. Now, with the expansion of the MPO boundary to include Coburg, the MPO RTP serves as the federally required plan for the new MPO area, while TransPlan will continue to serve as the state-required plan for the Eugene/Springfield area.

The layout and content of the MPO RTP is very similar to that of the TransPlan and therefore is only briefly summarized here. Chapter 2 of the MPO RTP contains goals and policies for transportation growth management in the MPO. The policies are identical to those found in the TransPlan and are provided in Appendix D. Chapter 3 contains lists of capital investment actions for transportation system improvements in several categories: roadways, transit and bicycle projects. The complete list of projects can be found at this website: http://docs.lcog.org/mpo/PDF/rtp/2031/2031RTP_Chapter3_Nov-07Adoption_Corrected.pdf.

Lane Transit District Capital Improvements Program (2010 – 2017)

The Lane Transit District (LTD) Capital Improvements Program (CIP) is a list of proposed projects that are intended to enhance transit within LTD's service area. While funding is expected for these projects, it is not guaranteed. Projects may be changed or eliminated due

to changes in priority or funding. The program is updated annually by the Board of Directors. The CIP project list includes projects that are specific to Eugene and those that apply to the entire transit district. A complete list of projects is provided in Appendix E.

Local Plans, Policies and Relevant Documents

Eugene Code Chapter 9 - Land Use (1971 – 2010)

Chapter 9 of the Eugene Code contains standards and regulations for land use and development in Eugene. It is intended to implement the goals and policies of the Metro Plan, refinement plans and applicable state and federal land use laws. The land use code will also need to implement the Eugene TSP once it is adopted. As such, revisions to the code may be necessary as part of the TSP development process, especially to ensure compliance with the requirements of TPR 660-012-0045 which identifies land use regulations that must be adopted to implement Transportation System Plans.

The most relevant sections of the Eugene Code in terms of the TSP are Sections 9.6800 – 9.6875, which regulate streets, alleys and other public ways. These sections contain standards for block length, connectivity, access and street right-of-way width that will need to be reviewed for consistency with the new Transportation System Plan. Although the code was updated to help implement TransPlan policies, the Eugene TSP development process will identify further revisions to the Eugene Code that might be needed in order to implement the new TSP once adopted.

Eugene Growth Management Policies (1997)

The Growth Management Policies were created by the Eugene Planning Commission and council liaisons based on a series of open houses, community workshops, tabloid responses, and surveys. These policies are intended to guide growth within the city of Eugene through the planning horizon. Policies especially relevant to the Eugene TSP are listed below.

- Policy 1 - Support the existing Eugene Urban Growth Boundary by taking actions to increase density and use existing vacant land and under-used land within the boundary more efficiently.
- Policy 2 - Encourage in-fill, mixed-use, redevelopment, and higher density development.
- Policy 5 - Work cooperatively with Metro area partners (Springfield and Lane County) and other nearby cities to avoid urban sprawl and preserve the rural character in areas outside the urban growth boundaries.
- Policy 10 - Encourage the creation of transportation-efficient land use patterns and implementation of nodal development concepts.
- Policy 11 - Increase the use of alternative modes of transportation by improving the capacity, design, safety, and convenience of the transit, bicycle, and pedestrian transportation systems.
- Policy 12 - Encourage alternatives to the use of single-occupant vehicles through demand management techniques.
- Policy 13 - Focus future street improvements on relieving pressure on the City's most congested roadways and intersections to maintain an acceptable level of mobility for all modes of transportation.

- Policy 14 - Development shall be required to pay the full cost of extending infrastructure and services, except that the City will examine ways to subsidize the costs of providing infrastructure or offer other incentives that support higher-density, in-fill, mixed-use, and redevelopment.
- Policy 15 - Target publicly-financed infrastructure extensions to support development for higher densities, in-fill, mixed uses, and nodal development.

Central Area Transportation Study (1987 – 2004)

The first Central Area Transportation Study (CATS) was completed in 1987, updated in 1993 and served as a technical element of the Central Eugene Parking and Traffic Circulation Plan, which was adopted by the Eugene City Council and the Lane Regional Air Pollution Authority. Its purpose has been to support maintenance and improvement of the city's transportation and parking systems, and to preserve air quality within the CATS boundaries.

The 2004 CATS Update was initiated because most recommendations from the original study had been implemented and other planning efforts that affect downtown have been undertaken. The CATS Update was also meant to inform the update of the Downtown Plan in 2004.

The CATS study area, as established in the original study, encompasses Downtown, the University of Oregon, Sacred Heart General Hospital sites, the Riverfront Research Park, parts of the Jefferson-Westside Neighborhood and Fairmount Neighborhoods, the new Federal Courthouse site, and EWEB-owned property to the north of that site.

The CATS Update includes policies and implementation strategies. The policies address the area's street system, pedestrian and bicycle facilities, transit system, vehicle parking, transportation demand management (TDM) programs, and the University of Oregon campus area. The policies are listed below.

Street System

- Promote the development of a transportation system within the downtown area that supports the goals of the Downtown Plan, enhances the livability of downtown, preserves the livability and economic vitality of areas within and directly adjacent to the CATS boundary, and provides for the safe and efficient movement of motor vehicles, pedestrians, bicycles, and transit vehicles.
- Maintain or improve the operation of the street system for pedestrians, bicycles, transit and automobiles. Balance the need for bicycle lanes on downtown streets with the need for on-street parking and transit facilities.

Pedestrian System

- Improve the pedestrian system in the downtown area to encourage walking as a primary means of transportation within downtown.
- Encourage and promote the creation of "great streets" within the downtown area that stimulate pedestrian activity while allowing for bicycles and slow-moving automobile traffic.

Bicycle Facilities

- Improve the safety and efficiency of existing bikeways in the downtown area. Improve bicycle circulation within the downtown area and improve access to existing and planned routes extending outside of the downtown area.

Transit System

- Support a frequent transit-based shuttle service in the greater downtown area to link major employment and activity centers and to provide an attractive, energy-efficient, low or no cost, transportation alternative for those who live, work or shop within the greater downtown area.

Vehicle Parking

- Support intensive development in the downtown area by balancing new parking supply with specific area demands and ensure an adequate supply of parking is available downtown to meet the needs of residents, workers and customers of downtown facilities.
- Make parking downtown convenient, affordable, safe and easy to use.

Transportation Demand Management (TDM) Program

- Promote walking, bicycling, carpooling, and riding the bus through employer-based programs.

University of Oregon Campus Area

- Support the transportation policies contained in the 1991 University of Oregon Long Range Campus Development Plan. [Note: The Campus Development Plan has been updated since CATS.]

The implementation schedule proposed in the study includes three categories, sometimes presented in phases: initial project planning, design, and public involvement; operational changes to the street system; and construction of new improvements or major modifications. The schedule spans mainly from 2004-2008, with a few recommended implementation strategies being carried out on an ongoing basis. Policies from this study will be reviewed by the DAC and PMT for the Eugene TSP and considered for policies of the TSP efforts.

Eugene Pedestrian & Bicycle Strategic Plan (2008)

The Eugene Pedestrian and Bicycle Strategic Plan is a five-year guiding document for the City of Eugene focused on creating a walkable and bikeable city. The plan is not an adopted regulatory document, nor is it a capital improvement document detailing the costs and programming of specific improvements. The city is currently working to update the Eugene Pedestrian and Bicycle Plan and anticipates adoption in June 2011. The new plan will be the bicycle/pedestrian element of the TSP and will be an official policy document.

The plan was designed to be consistent with the OTP, the Oregon Bicycle and Pedestrian Plan, and the Central Area Transportation Study (CATS), and to implement TransPlan. It

implements Action 4.2.3 of TransPlan, which calls for developing an implementation strategy for TransPlan bicycle and pedestrian projects.

The strategic plan is structured around the five goals, and identifies strategies for each goal. Multiple actions are identified for each strategy, along with the lead organization, partner organizations, the relative level of priority of the action (scale of 1-5), and the relative level of resources required (scale of 1-3).

Eugene Arterial and Collector Street Plan (ACSP) (1999)

The primary purpose of the ACSP is to provide Eugene with an updated street classification map and right-of-way map that identifies the community's major streets, and with appropriate street design standards and guidelines to apply to construction, reconstruction and improvement of those streets (the Eugene Local Street Plan design standards are also incorporated in adoption of the ACSP). The ACSP focuses on "developing a transportation system that balances mobility and access needs, provides for integration of land use and transportation systems, and provides for choices in modes of travel". It was developed to be consistent with TransPlan and to implement some of the action items identified in the Central Area Transportation Study.

The basic principles governing the design of arterials and collectors in the ACSP are:

- Facilitate movement and enhance mobility through the region;
- Create multi-modal streets to provide a range of transportation options;
- Ensure adequate emergency vehicle response routes;
- Accommodate and enhance economic vitality of the region;
- Support and complement local business;
- Consider individual characteristics of neighborhoods;
- Be consistent with nodal development concepts;
- Incorporate high-quality construction and design; and
- Provide mobility and access for all modes of travel.

The appendices to the ACSP contain the bulk of the relevant information, including the street classification map, right-of-way map, bicycle/pedestrian facility maps, street cross-sections with right-of-way widths, and design standards for specific street elements such as bike lanes, sidewalks and street trees. These classifications are described in the roadway section of this memo. Following the development of project alternatives and selection of TSP recommendations, the Eugene TSP will review the classifications from the ACSP and update as appropriate. Changes will likely require an amendment to the ACSP.

Eugene Parking Analysis Final Report, 2002 - 2006

While not an adopted policy document, this report is relevant because it provides a block-by-block analysis of parking deficits and surpluses in the downtown Eugene area. The 2006 update expanded the study area and reevaluated parking needs based on uses and development that had occurred since the original study. Maps showing parking deficits and surpluses for each block in the study area are provided and indicate a wide range of parking situations within the downtown. The Parking Analysis will inform the TSP process when

considering any potential changes to the transportation system through these downtown blocks.

Eugene Capital Improvement Program 2010-15, February 2009

The City of Eugene's Capital Improvement Program (CIP) forecasts the city's capital needs over a six-year period based on various long-range plans, goals and policies. The goals of the CIP are to:

- Provide a balanced program for capital improvements given anticipated funding revenues over a six-year planning period;
- Illustrate unmet capital needs based on anticipated funding levels, and;
- Provide a plan for capital improvements that can be used in preparing the Capital Budget for the coming two fiscal years.

The CIP is updated every two years and lists projects by category such as parks, stormwater and transportation. For each category, the CIP includes lists of projects with secured or identified funding, projects with no identified funding, and placeholder projects. The Eugene TSP will need to be consistent with projects that are identified in the CIP and the converse will also need to be true.

A list of CIP projects in the Transportation category can be found in Appendix F.

West Eugene Collaborative Recommendations (2009)

The West Eugene Collaborative (WEC) was formed in 2007 to "develop an integrated land use and transportation solution, supported by stakeholders, that will facilitate movement of people and commerce from/through/to west Eugene and west of Eugene while enhancing community, business and the environment." The recommendations in the March 2009 WEC report focus on problems with West 11th Avenue and Highway 126, but overall address concerns in an "area of interest" that spans from Downtown Eugene and I-5 to Veneta, and from the Eugene airport to the South Hills ridgeline. The report's recommendations were based upon eight principles that are listed below. It is important to note that these recommendations are not adopted policy, but are relevant in that they represent the views of a broad group of stakeholders within Eugene.

1. Improve efficiency of the transportation network.

2. Increase public transit.

3. Enhance pedestrian paths and bikeways.

4. Intensify development appropriately.

5. Relocate some land uses.

6. Enhance open space/natural resources.

7. Enhance natural watersheds.

8. Enhance appreciation and connections to natural resources.

The recommendations were grouped as short-, medium-, and long-range, and address transportation, land use, and environmental issues, and include such things as safety improvements to sidewalks and bike paths and support for mixed-use development and redevelopment.

Recommendations for implementation include adoption and/or enforcement of city policies and regulations to limit further encroachment into right-of-way along West 11th Avenue, and updates of the Metro Plan Diagram and city zoning map to identify protected natural areas as well as existing and planned wildlife habitat corridors. These recommendations were not adopted by Eugene City Council. They may be considered in the TSP though additional analysis would be required.

Roadway Network and Conditions

This section describes the current roadway network within the study area, including functional classification, ownership, and conditions. The roadway network is depicted in Figure 5.

Functional Classification

Functional classification defines a street's role and context in the overall transportation system. In addition, it defines the desirable roadway width, right-of-way needs, access spacing and pedestrian and bicycle facilities. The City of Eugene has established a functional classification system for the roadways owned by the City. Figure 5 illustrates the existing classifications as described in the Eugene Arterial and Collector Street Plan (ASCP). Functional classifications assessed as part of this TSP include major and minor arterials and major and minor collectors; local roadways are not analyzed as part of the Transportation System Plan.

Arterials

The primary function of arterial streets is to provide a high degree of vehicular mobility; however, they may also serve a minor role to provide access to individual properties. The nature of arterial streets dictates that their designs typically limit property access and on-street parking to improve traffic capacity for through traffic. Arterial streets are used as primary bicycle, pedestrian, emergency response routes and transit routes.

There are two classifications of urban arterial streets: major arterials and minor arterials. Because the function of both types is similar, the designs of major and minor arterials are also usually similar. Exceptions to this rule are freeways and expressways. While freeways and expressways are typically classified as major arterials, they have unique geometric criteria that control their design, and highly regulated access controls that limit access to adjacent land uses.

Collectors

The primary function of collector streets is to assemble traffic from the interior of an area and deliver it to the closest arterial street. Collectors provide for both mobility and access to property and are designed to fulfill both functions. They usually serve shorter trip lengths and have lower traffic volumes than arterial streets. Collector streets are also used as important emergency response routes and are frequently used as transit routes.

There are two classifications of collector streets: major collectors and neighborhood collectors. While the function of both types is essentially the same, the neighborhood collector classification is applied only in residential neighborhoods. Standards for neighborhood collectors provide for design flexibility to preserve the livability and character of residential areas.

State Roadways

ODOT owns the following roads within the Eugene TSP study area. Roadways are listed broken down by functional classification, as designated in the Eugene ACSP[5].

Freeways/Expressways

- Randy Papé Beltline, from W 11th Avenue to Interstate 5
- Interstate 105, from 6th Avenue/7th Avenueto Interstate 5
- Interstate 5, from North UGB to South UGB

Other Major Arterials

- Highway 99N, from North UGB to Garfield Street
- 6th Avenue, from Garfield Street to Interstate 105
- 7th Avenue, Garfield Street to Interstate 105
- W 11th Avenue, from West UGB to Randy Papé Beltline
- Franklin Boulevard, from Walnut Street to Interstate 5
- Delta Highway, portions of the Delta Highway interchange at Randy Papé Beltline

Minor Arterials

- Gilham Road, bridge structure at Randy Papé Beltline
- Norkenzie Road, bridge structure at Randy Papé Beltline
- Southwood Lane, from County Club Road to Coburg Road

Major Collectors

- Glenwood Boulevard, from Interstate 5 to the Interstate 5 off-ramp

Aside from Interstate 5, which has a speed of 60 mph through the study area, speed limits on ODOT owned facilities within the study area are generally 55 mph on freeways/expressways, 30-45 mph on other major arterials, and 35 – 40 mph on minor arterials and major collectors. All ODOT owned facilities are paved.

[5] Eugene ACSP street classifications and right-of-way needs are designed to be in agreement with those adopted by Lane County and the State of Oregon. However, the agency with jurisdiction over a particular roadway has the final authority on classification and right-of-way needs.

Lane County Roadways

Lane County Public Works (LCPW) owns the following facilities within the Eugene TSP study area. Roadways are listed broken down by functional classification, as designated in the Eugene ACSP.

Major Arterials

- Delta Highway, from Green Acres Road to Interstate 105
- River Road, from Irvington Drive to Federal Lane and from Corliss Lane to Park Avenue

Minor Arterials

- E 30th Avenue, from Spring Boulevard to East UGB
- Bailey Hill Road, from Bertelsen Road to Jarding Road
- Coburg Road, from Kinney Loop to County Farm Road
- Green Hill Road, from Barger Road to W 11th Avenue
- Irving Road, from Highway 99N to Belmont Street
- Irvington Drive, from Prairie Road to River Road
- Maxwell Road, from Prairie Road to NW Expressway and from Labona Drive to River Road
- NW Expressway from Irvington Drive to Maxwell Road and from north of Cornwall Avenue to Chambers Street
- Prairie Road, from Irving Road to northern City of Eugene boundary
- River Road, from Beacon Drive to Wilkes Drive
- Roosevelt Boulevard, from Randy Papé Beltlineto Danebo Avenue
- Royal Avenue, from Terry Street to roadway terminus

Major Collectors

- Beaver Street, from Hunsaker Lane to Division Avenue
- County Farm Road, from Fox Meadow Road to Coburg Road
- Enid Road, from Highway 99N to Prairie Road
- Glenwood Boulevard, from Interstate 5 off-ramp to Glenwood Drive
- Hunsaker Lane, from River Road to Beaver Street
- Old Coburg Road, from North UGB to Chad Drive
- Prairie Road, from Link Road to Irving Road
- Wilkes Drive, from River Road to Alameda Street

Minor Collectors

- Arrowhead Street, from City of Eugene boundary to Spearmint Street and from Calla Street to Dry Creek Road

- Barstow Avenue, from Arrowhead Street to Hyacinth Street
- Beacon Drive, from Daniel Drive to River Road and from Scenic Drive to W. UGB
- Blackfoot Avenue, from River Road to Hyacinth Street
- Calla Street, from Hyacinth Street to Kalmia Street
- Cornwall Avenue, from NW Expressway to Park Avenue
- Crocker Road, from Irvington Road to Irving Road
- Gilham Road, from Ayres Road to Ashbury Drive
- Gimpl Way, from Gimpl Hill Road to Gimpl Hill Road
- Gimpl Hill Road, from Gimpl Way to Bailey Hill Road
- Grove Street, from Maxwell Road to Silver Lane
- Horn Lane, from River Road to Park Avenue
- Howard Avenue, from Park Avenue to River Road
- Hyacinth Avenue, from Chimney Rock Lane to Naismith Boulevard and from Argon Avenue to Calla Street
- Kalmia Street, from Calla Street to Irving Road
- Lake Drive, from Howard Avenue to Horn Lane
- Lancaster Drive, from Lynnbrook Drive to Irvington Drive
- Lynnbrook Drive, from River Road to Lynnbrook Drive
- N Park Avenue, from Kelly Lane to Virgil Avenue and from NW Expressway to NW Expressway
- Park Avenue from River Road to City of Eugene boundary
- River Loop 1, from River Road to Dalewood Street
- River Loop 2, from River Road to Burlwood Street
- Scenic Drive, from River Loop 2 to North UBG
- Spring Creek Drive, from River Road to Scenic Drive
- Willow Creek Road, from the Eugene ownership boundary to Mt Valvue Lane

Lane County also owns local roadways throughout the study area, including several in the River Road/Santa Clara area where many parcels are located outside the Eugene City limits. Speed limits are generally 35 – 55 mph on major and minor arterials, and 25 – 40 mph on major and minor collectors. All Lane County arterials and collectors are paved.

City of Eugene Roadways

Major Arterials

Design Standards

In Eugene, major arterials typically have four or more lanes and, with the exception of freeways and expressways, typically have sidewalks, striped bicycle lanes, and raised

median islands or two-way left turn lanes. Some major arterials also have planting strips. The Eugene ACSP includes guidelines and street design standards by functional classification type. For major arterials, which should be able to accommodate 20,000 average daily traffic (ADT) volumes per day, the ACSP provides the following design guidelines and standards:

- Curb-to-curb pavement widths should range from 68' to 94'
- Total right-of-way widths should range from 100' to 120'
- Travel lanes should be a minimum of 11' wide
- Sidewalks should be continuous, located on both sides of the street, and setback from the curb
- Minimum sidewalk widths are 10' for curbside sidewalks in pedestrian-oriented commercial areas and 5' setback elsewhere (some exceptions apply)
- Striped bicycle lanes are required on both sides of newly constructed or widened arterial streets, should be a minimum of 5' - 6' wide, and should be free from drainage grates and utility covers

City of Eugene Major Arterials

The City of Eugene owns the following major arterials within the Eugene TSP study area:

- 6th Avenue, from I-105 to Mill Street
- 7th Avenue, from I-105 to Mill Street
- W 11th Avenue, from Randy Papé Beltline to Garfield Street
- Broadway, from Mill Street to Franklin Boulevard
- Chambers Street, from NW Expressway to 7th Avenue
- Coburg Road, from Crescent Avenue to Mill Street (including the Ferry Street Bridge and viaduct)
- Franklin Boulevard, from Broadway to Walnut Street
- Garfield Street, from 6th Avenue to W 11th Avenue
- Mill Street, from Coburg Road to Broadway
- Mill Street, segment from Mill Street to westbound on Broadway
- River Road, from Federal Lane to Corliss Lane and from Park Ave to NW Expressway

River Road at River Avenue, looking south.

Major arterials observed in Eugene ranged from having 4 one-way travel lanes with no bike lanes and sidewalks on both sides of the street (6th and 7th avenues) to having 4 travel lanes, a center turn lane, and sidewalks and narrow bike lanes on both sides of the street (both River Road and Coburg Road). All city-owned major arterials are paved.

Minor Arterials

Design Standards

Minor arterials connect the nearby rural areas to cities and function within cities as conduits for a large proportion of intra-urban trips. In Eugene a typical minor arterial contains two lanes plus a center turn lane, with bike lanes, planting strips (in some cases), and sidewalks. Some minor arterials are wider and contain up to 4 lanes plus turn lanes or median islands. For minor arterials, which should be able to accommodate an ADT of 7,500 - 20,000, the Eugene ACSP provides the following design guidelines and standards:

- Curb-to-curb pavement widths should range from 46' to 70'
- Total right-of-way widths should range from 75' to 100'
- Travel lanes should be a minimum of 11' wide
- Sidewalks should be continuous, located on both sides of the street, and setback from the curb
- Minimum sidewalk widths are 10' for curbside sidewalks in pedestrian-oriented commercial areas and 5' setback elsewhere (some exceptions apply)
- Striped bicycle lanes are required on both sides of newly constructed or widened arterial streets, should be a minimum of 5' - 6' wide, and should be free from drainage grates and utility covers

City of Eugene Minor Arterials

The following minor arterial streets are owned by the City of Eugene:

- 8th Avenue, from Pearl Street to Coburg Road
- 11th Avenue, from Garfield Street to Franklin Boulevard
- 13th Avenue, from Garfield Street to Hilyard Street
- 18th Avenue, from Willow Creek Road (western) to Agate Street
- 20th Avenue, from Willamette Street to Oak Street
- 24th Avenue, from Willamette Street to Agate Street
- 28th Avenue, from Chambers Street to Lorane Highway
- 29th Avenue, from Lorane Highway to Amazon Parkway
- 30th Avenue, from Hilyard Street to Spring Boulevard
- Agate Street, from Franklin Boulevard to 24th Avenue
- Airport Road, from West UGB to Highway 99
- Amazon Parkway, from Pearl Street to Hilyard Street

Barger Drive at Randy Papé Beltline is a minor arterial with a curb to curb width of 88 feet.

- Bailey Hill Road, from Bertelsen Road to 5th Avenue
- Barger Drive, from Greenhill Road to Highway 99
- Bertelsen Road, from Royal Avenue to Bailey Hill Road
- Cal Young Road, from Willagillespie Road to Coburg Road
- Martin Luther King Jr. Boulevard, from Coburg Road to I-5
- Chambers Street, from 7th Avenue to Lorane Highway
- Club Road, from Country Club Road to Martin Luther King Jr. Boulevard
- Coburg Road, from County Farm Road to Crescent Avenue
- Country Club Road, from Willagillespie Road to Club Road
- Crescent Avenue, from Norkenzie Road to Game Farm Road
- Danebo Avenue, from Royal Avenue to W 11th Avenue
- East Amazon Drive, from Hilyard Street to Dillard Road
- Echo Hollow Road, from Barger Drive to Royal Avenue
- Game Farm Road, from Coburg Road to I-5
- Garfield Street, from 11th Avenue to 13th Avenue
- Gilham Road, from Crescent Drive to Cal Young Road
- Goodpasture Island Road, from Valley River Drive to Norkenzie Road
- Green Acres Road, from Delta Highway to Norkenzie Road
- Greenhill Road, from Barger Drive to Highway 126 (W 11th Avenue)
- Harlow Road, from Coburg Road to I-5
- High Street, from 6th Avenue to 19th Avenue
- Hilyard Street, from Franklin Boulevard to West Amazon Drive
- Irving Road, from Belmont Street to River Road
- Jefferson Street, from 7th Avenue to 13th Avenue
- Maxwell Road, from River Road to Labona Drive
- Norkenzie Road, from Green Acres Road to Cal Young Road
- Northwest Expressway, from Maxwell Road to north of Cornwall Avenue
- Oak Street, from 6th Avenue to 20th Avenue
- Oakway Road, from Cal Young Road to Coburg Road
- Patterson Street, from Franklin Boulevard to 23rd Avenue/Hilyard Street
- Pearl Street, from 6th Avenue to 19th Avenue
- Prairie Road, from Highway 99 to City of

Pearl Street at 16th Avenue is a minor arterial and contains two 12 foot travel lanes, and 5 foot bicycle lanes on both sides of the road.

Eugene boundary

- Roosevelt Boulevard, from Chambers Street to Randy Papé Beltlineand from Danebo Avenue to Terry Street
- Royal Avenue, from Highway 99 to Terry Street
- Seneca Road, from Roosevelt Boulevard to W 11th Avenue
- Terry Street, from Barger Drive to Morely Loop
- Valley River Drive, from Goodpasture Island Road to Willagillespie Road
- Washington Street, from 7th Avenue to 13th Avenue
- West Amazon Drive, from Hilyard Street to Fox Hollow Road
- Willagillespie Road, from Cal Young Road to Country Club Road
- Willamette Street, from 13th Avenue to South UGB
- Willow Creek Road, from 11th Avenue to 18th Avenue

Minor arterials observed in Eugene ranged from having a curb to curb width of 33 feet (Pearl Street at 16th Avenue) to 88 feet (Barger Drive at Randy Papé Beltline). Some minor arterials contain two travel lanes (such as Hilyard Street at 22nd Avenue and Pearl Street at 16th Avenue) while others contain up to four travel lanes with a center turn lane (Barger Drive at Randy Papé Beltline). The majority of minor arterials observed contained sidewalks on both sides of the road that were a minimum of 5 feet in width. Bicycle lanes were also generally present on both sides of the road (with the exception of Hilyard Street at 22nd Avenue) and were generally 5 feet in width. All city-owned minor arterials were paved and pavement quality ranges from good to like new.

Major Collectors

Design Standards

In Eugene, major collectors frequently have continuous center turn lanes and are normally provided with sidewalks, planting strips, and striped bike lanes; provision for on-street parking varies by location. Major collectors may be designed with raised medians to reduce conflicts, provide a pedestrian refuge, restrict turning movements, limit land access, or to furnish an aesthetic separation between traffic lanes. For major collectors, which should be able to accommodate an ADT of 2,500 - 7,500, the Eugene ACSP provides the following design guidelines and standards:

- Curb-to-curb pavement widths should range from 32' to 44’
- Total right-of-way widths should range from 60' to 75'
- Travel lanes should be a minimum of 10’ wide
- Sidewalks should be continuous, located on both sides of the street, and setback from the curb
- Minimum sidewalk widths are 10’ for curbside sidewalks in pedestrian-oriented commercial areas and 5’ setback elsewhere (some exceptions apply)

- Striped bicycle lanes are required on both sides of newly constructed or widened collector streets, should be a minimum of 5′ - 6′ wide, and should be free from drainage grates and utility covers

City of Eugene Major Collectors

The following major collectors are owned by the City of Eugene:

- 1st Avenue, from Seneca Road to Bertelsen Road
- 1st Avenue, from Washington Street to Van Buren Street/Railroad Boulevard
- 2nd Avenue, from Blair Boulevard To Garfield Street
- 3rdAvenue, from High Street to Coburg Road
- Shelton McMurphey Boulevard, from Washington Street to Pearl Street
- 4th Avenue, from Pearl Street to Coburg Road
- 5th Avenue, from Bailey Hill Road to Highway 99
- 5th Avenue, from Blair Boulevard To Washington Street
- 7th Avenue, from Bailey Hill Road to Highway 99
- 13th Avenue, from Hilyard Street to Kincaid Street
- 19th Avenue, from Hilyard Street to Agate Street
- 19th Avenue, from Willamette Street to Hilyard Street
- 24th Avenue, from Chambers Street to Jefferson Street
- 27th Avenue, from Portland Street to Amazon Parkway
- 40th Avenue, from Willamette Street to Hilyard Street
- Alder Street, from Broadway to 18th Avenue
- Arthur Street, from 13th Avenue to 18th Avenue
- Awbrey Lane, from Highway 99 to UGB
- Ayres Road, from Delta Highway to Gilham Road
- Blair Boulevard, from 2nd Avenue to Monroe Street
- Chad Drive, from Coburg Road to Game Farm Road
- City View Street, from 11th Avenue to 18th Avenue
- City View Street, from 18th Avenue to 28th Avenue
- County Farm Road, from Dale Avenue to Coburg Road
- Delta Highway, from Green Acres Road to Ayres Road
- Dillard Road, from East Amazon Drive to South UGB
- Division Avenu, from Randy Papé Beltline to River Road
- Donald StreetStreetSt,Street from Willamette Street to 40th Avenue
- Fox Hollow Road, from West Amazon Drive to south UGB
- Garden Way, from Martin Luther King Jr. Boulevard to Harlow Road

- Garfield Street, from Roosevelt Boulevard to 6th Avenue
- Gilham Road, from Ayres Road to Crescent Avenue
- Goodpasture Loop, from Goodpasture Island Road to Goodpasture Island Road
- Hawkins Lane, from 18th Avenue to 25th Avenue
- High Street, from 3rd Avenue to 6th Avenue
- Hilyard Street, from W Amazon Parkway to 40th Avenue
- Jefferson Street, from 13th Avenue to 28th Avenue
- Jefferson Street, from 1st Avenue to 7th Avenue

Jefferson Street is a major collector in the Jefferson-Westside Neighborhood.

- Kincaid Street, from 11th Avenue to 13th Avenue
- Leo Harris Parkway, from Martin Luther King Jr. Boulevard to Martin Luther King Jr. Boulevard
- McKinley Street, from 11th Avenue to Highway 99
- Oak Patch Road, from 11th Avenue to 18th Avenue
- Oakmont Way, from Oakway Road to Sorrel Way
- Olive Street, from 13th Avenue to 18th Avenue
- Pearl Street, from 4th Avenue to 6th Avenue
- Polk Street, from 2nd Avenue to 28th Avenue
- Railroad Boulevard, from River Road to 1st Avenue
- River Avenue, from River Road to Randy Papé Beltline
- Silver Lane, from Grove Street to River Road
- Terry Street, from Arrowsmith Street to 11th Avenue
- Terry Street, from UGB to Barger Drive
- Executive Parkway, from Valley River Drive to south
- Valley River Way, from Valley River Drive to south
- Washington Street, from 1st Avenue to 7th Avenue
- Willakenzie Road, from Cal Young Road to Bogart Lane

Major collectors observed in Eugene ranged from having two travel lanes, a center turn lane, 5 foot wide bike lanes, and 5 foot wide sidewalks (e.g. River Avenue) to just two travel lanes divided by a double yellow line with sidewalks on both sides of the street and no bike lanes (e.g. High Street and 3rd Avenue). Jefferson Street contains two one-way travel lanes and has on-street parking in lieu of striped bicycle lanes. All city-owned major collectors are paved.

Neighborhood Collectors

Design Standards

Neighborhood collectors (also referred to as minor collectors in other jurisdictions) are found only in residential neighborhoods and provide a high degree of access to individual properties. Neighborhood collectors are required to have sidewalks and planting strips. As a rule, left turn lanes are only infrequently used on neighborhood collectors, and then only at intersections with higher volume streets. On most neighborhood collectors, on-street parking is flexible and bicycles share the travel lane with other motor vehicles. For neighborhood collectors, which should be able to accommodate an ADT of 1,500 - 2,500, the Eugene ACSP provides the following design guidelines and standards:

- Curb-to-curb pavement widths should range from 20' to 43'
- Total right-of-way widths should range from 40' to 55'
- Travel lanes should be a minimum of 10' wide
- Sidewalks should be continuous, located on both sides of the street, and setback from the curb
- Sidewalks should be a minimum of 5' wide (some exceptions apply)
- Bicycles generally share the travel lane with motor vehicles (some exceptions apply)

City of Eugene Neighborhood Collectors

The following neighborhood collectors are owned by the City of Eugene:

- 16th Avenue, from Riverview Street to Augusta Street
- 19th Avenue, from Agate Street to Fairmount Boulevard
- 24th Avenue, from Agate Street to Columbia Street
- 25th Avenue, from Brittany Street to Hawkins Lane
- 27th Avenue, from Lincoln Street to Portland Street
- 28th Avenue, from Chambers Street to City View Street
- 33rd Avenue, from Willamette Street to Hilyard Street
- 39th Avenue, from Willamette Street to 40th Avenue/Brae Burn Drive
- 43rd Avenue, from Dillard Road to North Shasta Loop
- 43rd Avenue, from Donald Street to Fox Hollow Road
- 46th Avenue, from Willamette Street to Fox Hollow Road
- Agate Street, from 30th Avenue to Spring Boulevard
- Arrowhead Street, from Irvington Drive to Calla Street and from Dry Creek Road to Irving Road
- Augusta Street, from 16th Avenue to 26th Avenue
- Bailey Lane, from Coburg Road to Bogart Lane
- Bethel Drive, from Highway 99 to Roosevelt Boulevard

- Bogart Lane, from Willakenzie Road to Bailey Lane
- Brae Burn Drive, from Willamette Street to W 40th Avenue
- Brittany Street, from 18th Avenue to 25th Avenue
- Columbia Street, from 24th Avenue to 27th Avenue
- Danebo Avenue, from Barger Drive to Souza Street
- Donald Street, from 40th Avenue to Fox Hollow Road
- Elmira Road, from Bertelsen Road to Maple Street
- Fairfield Avenue, from Highway 99 to Royal Avenue
- Fairmount Boulevard, from 19th Avenue to Summit Avenue
- Fir Land Boulevard, from Agate Street to Spring Boulevard
- Floral Hill Drive, from Summit Avenue to 20th Avenue
- Friendly Street, from 18th Avenue to 28th Avenue
- Harris Street, from 18th Avenue to 30th Avenue
- Hawkins Lane, from 25th Avenue to Wintercreek Drive
- Hyacinth Street, from Torrington Avenue to Chimney Rock Lane and from Naismith Boulevard to City boundary and from Argon Avenue to Irvington Drive
- Jeppesen Acres Road, from Gilham Road to Coburg Road
- Kevington Street, from Warren Street to Brittany Street
- Kinsrow Avenue/ Commons Drive, from Martin Luther King Jr. Boulevardto Garden Way
- Lakeview Drive/Parkview Drive, from Gilham Road to County Farm Road
- Lancaster Drive, from UGB Lynnbrook Drive
- Lincoln Street, from 13th Avenue to 29th Avenue
- Lynnbrook Drive, from Lancaster Drive to Lynnbrook Drive
- Maple Street, from Elmira Road to Roosevelt Boulevard
- Marshall Avenue, from Echo Hollow Road to Hughes Street
- Minda Avenue, from Norkenzie Road to Gilham Road
- Monroe Street, from 8th Avenue to 13th Avenue
- North Park Avenue, from Northwest Expressway to Maxwell Road
- North Shasta Loop, from Spring Boulevard /Agate Street to 43rd Avenue
- Park Avenue, from NW Expressway to Virgil Avenue and from Kelly Lane to Howard Avenue
- Riverview Street, from Franklin Boulevard/I-5 Southbound Ramp to 16th Avenue
- Satre Street, from Bailey Lane to Western Drive
- Spring Boulevard, from 30th Avenue to Firland Boulevard
- Summit Avenue, from Fairmount Boulevard to Floral Hill Drive

- Taney Street, from Barger Drive to Marshall Street
- Timberline Drive, from Warren Street to Wintercreek Drive
- Van Buren Street, from 1st Avenue to Blair Boulevard
- Van Duyn Street, from Western Drive to Harlow Road
- Warren Street, from Bailey Hill Road to Timberline Drive
- West Amazon Drive, from Fox Hollow Road to Snell Street
- Willow Creek Road, from 18th Avenue to the Lane County ownership boundary
- Wintercreek Drive, from Timberline Drive to Hawkins Lane

Lincoln Street is a neighborhood collector in the Jefferson-Westside Neighborhood.

Bethel Drive is a neighborhood collector in the Trainsong Neighborhood.

Neighborhood collectors observed in Eugene ranged from having two narrow marked travel lanes with no shoulders, sidewalks, or bike lanes (e.g. Bethel Drive) to having no lane striping, no bike lanes, and on-street parking and sidewalks on both sides of the street (e.g. Lincoln Street). All city-owned neighborhood collectors are paved.

Local Streets

Local streets carry a lower volume of traffic than collectors and arterials, and provide direct access to neighborhoods and homes. Local streets generally feed into collector streets. The majority of local streets within the study area are owned by the City of Eugene; however, both ODOT and Lane County own some local streets as well. Local streets are not analyzed as part of this TSP.

Freight Routes

State freight routes and federally designated truck routes and intermodal connectors within the study area are depicted in Figure 6 and are described in the following section.

Freight and Truck Routes

The State Highway Freight System, as designated in the Oregon Highway Plan (OHP), includes the following freight routes within the study area[6]:

6 http://egov.oregon.gov/ODOT/TD/TDATA/gis/docs/STATEMAPS/FreightSystem.pdf

- Interstate 5, from North UGB to South UGB (freeway)
- Interstate 105/OR 126, from 6th /7th avenues to Interstate 5 (freeway)
- Randy Papé Beltline, from W 11th Avenue to Interstate 5 (freeway/expressway)
- Oregon Route 126/ W 11th Avenue, from West UGB to Randy Papé Beltline
- Oregon Route 99, from UGB to Randy Papé Beltline

In addition to the above, the following routes are part of the National Highway System (NHS) and are federally designated truck routes:

- Franklin Boulevard, from Interstate 5 to E Broadway
- E Broadway, from Franklin Boulevard to Mill Street
- Mill Street, from E Broadway to E 6th Avenue
- E 6th Avenue, from Mill Street to Highway 99N (at 5th Avenue)
- E 7th Avenue, from Mill Street to Highway 99N (at 5th Avenue)
- Highway 99N, from Randy Papé Beltline to E 7th Avenue (at 5th Avenue)

The difference between freight and truck routes is the agency that is authorized to make changes (mobility standards, construction, etc) to the routes. Federally designated truck routes need Federal Highway Administration (FHWA) approval while state routes need ODOT and/or local government approval. State freight routes have higher mobility standards than other state highways, but these mobility standards apply to freight routes only. The NHS truck routes also have certain standards, such as truck size, that must be met. In Eugene, the state freight routes generally correspond with the interstate highway system and the truck routes generally correspond with other major arterials within Eugene.

Intermodal Connectors

Intermodal connectors are roadways that provide access between major intermodal facilities and the National Highway System. The identified major intermodal facilities in Eugene include the Eugene Airport, Amtrak Station, Greyhound Bus Terminal, Eugene Transit Station, and the truck/rail reloading facilities within the Trainsong Neighborhood. The following street segments in Eugene are designated as intermodal connectors on the National Highway System:

- Garfield Street from 7th Avenue to Cross Street
- Cross Street from Garfield Street to Cleveland Street
- Cleveland Street from Cross Street to Roosevelt Boulevard
- Roosevelt Boulevard from Cleveland Street to OR 99
- Lockheed Drive from Greenhill Road to the Passenger Terminal
- Airport Road from Greenhill Road (west leg) to OR 99
- Oak Street from 7th Avenue to 5th Avenue
- 5th Avenue from Oak Street to Willamette Street
- Willamette Street from Amtrak station to 6th Avenue
- Willamette Street from 11th Avenue to 10th Avenue
- Charnelton Street from 6th Avenue to 10th Avenue
- Pearl Street from 6th Avenue to 10th Avenue
- High Street from 10th Avenue to 6th Avenue
- 10th Avenue from Charnelton Street to Pearl St

- 11th Avenue from Franklin Boulevard to Willamette Street

Opportunities for improvements to the freight system identified in the Draft 2010 Oregon Freight Plan are discussed in the Freight System Deficiencies section.

Traffic Operational Analysis

The TSP is intended to provide an understanding of regional needs and strategies to guide the management of the City's transportation system. These efforts are not intended to provide a comprehensive listing of citywide improvement needs, but rather to identify some of the key roadway and intersection needs. To understand system needs, the operational and safety performance of the existing transportation system was reviewed at 50 intersections throughout the City. Study intersections were selected based on the following criteria:

- Regionally significant facilities
- Intersections that may require future improvements and would therefore be part of a Capital Improvements Program (as noted through field observations, previous studies, and/or conversations with city staff)
- Land use, environmental and/or geometric opportunities and constraints, including those intersections that are already built out to the degree that may be feasible and/or desirable in the future
- Data and analyses needs for the Envision Eugene process

The location of the selected study intersections are shown in Figure 7. The vast majority of the study intersections (46 of 50) are controlled by traffic signals (herein referred to as "signalized").

The following sections describe the operational and safety performance of each of the intersections. Additional documentation is provided in the following Appendices:

- Appendix G: Technical Memorandum – Methods and Assumptions (Kittelson & Associates, Inc., October 2010)
- Appendix H: Traffic Volume Data
- Appendix I: Crash Data
- Appendix J: Existing Condition Operational Analysis Worksheets

During the development of the TSP it may be necessary to amend this initial listing of study intersections with other locations that are identified as critical in gaining an understanding of assessing the citywide needs.

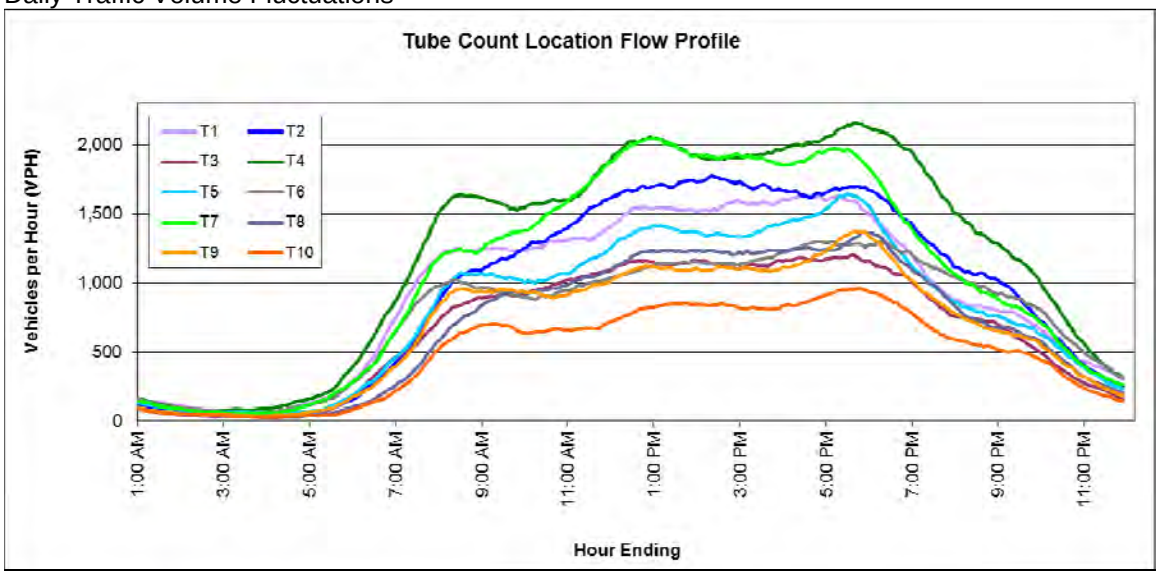
Design Hour Traffic Volumes

Traffic volumes throughout the City of Eugene were reviewed to understand how traffic flows vary throughout a typical weekday (e.g., Monday through Friday during months of the year when school and the University of Oregon is in session). Typically, traffic volumes peak during the weekday p.m. peak hour. This time period is representative of when travelers use the transportation system to travel to and from work, run errands, and travel

to dining. At specific intersection locations, the land uses in the vicinity of the intersection may cause other peaking in traffic volumes to occur, such as near a school or large employer with shift changes that occur outside of a typical 4:00 to 6:00 p.m. period, or during large events at the University of Oregon.

The review of traffic volumes used peak hour turning movement counts at more than 100 intersections as well as 72-hour roadway tube counts recorded on ten key roadways. The graph below illustrates the traffic flows throughout the day, highlighting the distinct morning, midday, and evening commute periods at each of the tube count locations. The locations of each of the tube counts are shown in Figure 7.

Daily Traffic Volume Fluctuations



As shown in the graph, the highest combined bi-directional volumes are generally experienced during the evening commute period. On West 11th Avenue (Tube 7) and Coburg Road (Tube 2), traffic volumes are slightly higher during the midday peak hour.

Based on the review of existing daily traffic fluctuations, the weekday p.m. peak hour traffic volumes at each of the study intersections were used as the basis for calculating design hour volumes. As discussed in Appendix G: Technical Memorandum – Methods and Assumptions, the existing weekday p.m. peak hour volumes were adjusted to 30th highest hour conditions using the Seasonal Trend Methodology outlined in ODOT's Analysis Procedures Manual (APM) assuming Eugene is representative of a "commuter" community.

Intersection Operating Standards

Per TransPlan, the City of Eugene and Lane County base intersection operations on level-of-service (LOS). Both jurisdictions currently specify a minimum performance of LOS "D" at signalized intersections (less than 55 seconds of average per vehicle control delay). Within the Central Area Transportation Study Area Boundary (primarily downtown and near the University), the city allows LOS "E" (less than 80 seconds of average per vehicle control

delay) for intersection operations. This reduced priority for vehicle throughput allows the City to allocate higher proportions of right-of-way to other travel modes within these areas.

The 1999 Oregon Highway Plan (OHP) outlines specific performance measures to be maintained along ODOT facilities as part of adopted Highway Mobility Standards. These standards are based on volume to capacity (v/c) ratios and are aimed at maintaining mobility along important road corridors and vary according to functional classification, location, and role within the National Highway System (NHS).

Per the OHP, the following intersection performance measures are applicable for the ODOT facilities within Eugene:

- Volume-to-capacity (v/c) ratio of 0.80 for Interstate 5 and Interstate 105, given their designation as Interstate facilities within a Metropolitan Planning Organization (MPO).
- Volume-to-capacity (v/c) ratio of 0.80 for Randy Papé Beltline (OR 569) from OR 126 to I-5 given its classification as a Statewide Highway Expressway within a MPO[7].
- Volume-to-capacity ratio of 0.85 for Highway 99 south of Randy Papé Beltline, given its classification as a Statewide NHS route and Truck Route. In addition, a v/c of 0.85 is applicable for all of the ramp termini within this segment. North of the Randy Papé Beltline and within the MPO boundary the applicable mobility standard is a volume-to-capacity (v/c) ratio of 0.80 due to its classification as a Freight Route.

The OHP standards above reflect signalized performance standards. At stop-controlled intersections where through highway movements do not experience control delay the appropriate mobility standard is based on the classification of the intersecting roadway.

Intersection Operations Analyses

Analyses of intersection performance relative to City and County level of service standards and ODOT mobility standards were performed based on the methodologies outlined in Appendix G: Technical Memorandum – Methods and Assumptions. The results of this analysis are summarized in Table 3 and Figure 8. As shown in Table 3, eight of the study intersections do not meet performance standards today. A more detailed discussion on each intersection that doesn't currently meet standards is provided below.

At other study area locations, there may be times of the day when queuing or congestion is experienced but the overall intersection operations meet standards today for the 30th highest hour condition. This is especially true for those intersections in the vicinity of schools that experience short periods of congestion during student drop-off and pick-up.

TABLE 3
Intersection Performance Summary for 30th Highest Hour Conditions

Intersection Name		Performance Standard			Intersection Performance Metrics				Meets Standard?
		Intersection Control	Jurisdiction	Performance Standard	Critical Movement	LOS	Delay (s)	v/c	
1	Randy Papé Beltline Westbound	TWSC	ODOT	0.85 v/c	WB	F	>> 50	> 1	No

[7] Highway OR 569 continues west along W 11th Avenue (OR 126) transitioning to OR Highway 126. Within the MPO boundary W 11th Avenue is classified as a Statewide Highway, Freight Route, and Truck Route, and contains the same mobility standards (v/c of 0.80).

Intersection Name		Performance Standard			Intersection Performance Metrics				Meets Standard?

TWSC = Two-way stop-controlled; EB = eastbound; WB = westbound; v/c = volume-to-capacity ratio

Intersection 1, 2. Northwest Expressway and Randy Papé Beltline Ramps (Eastbound and Westbound)

The intersection of Northwest Expressway and Randy Papé Beltline Ramps are under the jurisdiction of Lane County and ODOT. Today, drivers exiting Randy Papé Beltline access Northwest Expressway at stop-controlled intersections. At this location, the mainline of Randy Papé Beltline is above the grade of Northwest Expressway. With the high volume of through traffic on Northwest Expressway, drivers exiting Randy Papé Beltline can experience long delays (corresponding to level of service "F") trying to turn left onto Northwest Expressway.

Preliminary analyses conducted as part of the Existing Conditions review revealed that neither ramp intersection warrants installation of a traffic signal under today's conditions.

Intersection 7. Randy Papé Beltline/Roosevelt Boulevard

The signalized intersection at Roosevelt Boulevard marks the transition of Randy Papé Beltline from a grade-separated facility to a suburban/urban arterial with at-grade

intersections. At this intersection, the posted speeds of both facilities are still typical of a grade-separated environment: Randy Papé Beltline is posted at 55 miles per hour and Roosevelt Boulevard is posted at 45 miles per hour. An off-street pedestrian/bicycle trail paralleling Roosevelt Boulevard provides access to crossing opportunities via the northeast and northwest corners of the intersection.

The intersection operates at level-of-service "D" but with a volume-to-capacity ratio of 0.85, which exceeds the ODOT standard of 0.80. There are dedicated turn lanes on each of the approaches for the intersection and Randy Papé Beltline has two through travel lanes in each direction and Roosevelt Boulevard has one through lane in each direction. Previous discussions and studies have identified the need for improved connectivity in this area of the City as well as increased transit service, which may help provide alternative routes and modes for travelers as the area continues to grow.

Intersection 8. Randy Papé Beltline/West 11th Avenue

This intersection marks the terminus of Randy Papé Beltline at West 11th Avenue, though OR 569 continues west along OR 126W. The signalized intersection currently operates at capacity and level-of-service "E" conditions, given the high turning movement volumes that are facilitated at this location that result from limited travel route choices in this area. At the intersection, West 11th Avenue has two through lanes in each direction and a dedicated left-turn lane on the eastbound approach and a dedicated right-turn lane on the westbound approach. Randy Papé Beltline has a right-turn and a left-turn lane.

Two studies have recently been completed to assess needs along the West 11th Avenue corridor. The WEC Study (2009) identified a need for connectivity improvements, transit improvements, traffic signal improvements, and the construction of a multi-way boulevard in order to provide congestion relief to West 11th Avenue. The WEC study is completed but has not been adopted by City Council – any recommendations from the study would require further analysis and review. The West 11th Avenue corridor study completed in 2009 report focused on assessing intersection performance and mobility needs along the West 11th corridor.

Intersection 20. Garfield Street/West 13th Avenue

The land uses surrounding this intersection are a mixture of residential and small commercial uses. The Unsignalized intersection of Garfield Street and W 13th Avenue is unconventionally configured to allow freeflow conditions for the higher volume southbound movement. The intersection contains extensive signs warning drivers of the transition from a southbound to westbound (one-way) alignment.

This intersection facilitates a fairly low volume of eastbound vehicles today although the per-vehicle delays are high. This intersection was analyzed as part of the West 11th Avenue Corridor Study for operations and safety. There is sufficient capacity at the intersection for the eastbound movement and a traffic signal is not warranted at this location based on the existing conditions review.

Intersection 41. Delta Highway Southbound Ramps/Valley River Drive

This intersection provides access between the Delta Highway southbound on and off-ramps and connects to neighborhoods to the east with a Delta Highway overcrossing. Delta

Highway is a regionally significant facility that provides north-south freeway connectivity throughout the city and offers connections to Randy Papé Beltline, I-105, residential and commercial uses within the City, and the industrial areas in the County. The intersection with Valley River Drive occurs in a predominantly retail area. Residential uses and the Willagillespie Elementary School are located on the east side of the interchange. There is a retail access in the immediate vicinity of the intersection resulting in several access points along Valley River Drive between the Delta Highway ramps and Goodpasture Island Road.

The intersection currently operates at capacity and level-of-service "E." There are turn lanes on all approaches and two through lanes on Valley River Drive at the intersection. Any mitigation-related measures for this intersection will need to consider the overall connectivity provided to neighborhoods to the east as well as to the regional highway system.

Intersection 45. Chambers Street/West 6th Avenue

Within downtown Eugene, West 6th Avenue forms an east-west couplet with West 7th Avenue as part of Highway 99. The Chambers Street intersection is bounded by small retail uses that are provided access within the grid system of downtown streets. This intersection is outside of the Central Area Transportation Study boundaries. Although intersection delays correspond to level-of-service "D" conditions today, it does not meet ODOT mobility standards for Highway 99. There are turn lanes on each of the approaches and Chambers Street has two northbound through lanes and three southbound lanes (two becoming left-turn lanes at 7th Avenue) whereas West 6th Avenue has four through lanes (one way). Northbound Chambers Street has two lanes crossing and proceeding away from West 6th Avenue. Any future modifications will need to be considered within the context of the regional system, given the significance of Chambers Street and Highway 99 in providing multimodal mobility throughout Eugene and to areas outside the city.

Intersection 46. Madison Street/West 6th Avenue/I-105 Ramp

This intersection provides access between westbound Highway 99 and southbound I-105. The western CATS boundary is Lincoln Street. The intersection operates at a level-of-service "B" but exceeds ODOT mobility standards. The off-ramp volumes are high and are given preferential treatment in the timing of the traffic signal but the movement operates close to capacity. As a result, the overall intersection delays are low but the v/c is high. The ability to make any geometric modifications at this intersection is somewhat constrained by the presence of I-105 and the viaduct.

The City is considering the removal of the westbound right-turn movement from West 6th Avenue that crosses the I-105 southbound off-ramp. This low-volume movement can be accommodated through alternative routes, and its removal would provide a substantial improvement in intersection operations. In addition, treatments have been considered to prohibit lane changes immediately west of the intersection either through signage or construction of channelizing islands to reduce the sideswipe collision history and improve operations.

OR 569 Beltline Highway: River Road to Coburg Road Facility Plan

The Beltline Highway study identified five intersections that were exceeding intersection operations standards in 2008, as listed below.

- Division Avenue And Beaver Road
- Coburg Road And Chad Drive
- Delta Highway Northbound Ramps And Goodpasture Island Road
- Coburg Road And Eastbound Beltline Highway On/Off Ramps
- Coburg Road And Westbound Beltline Highway On/Off Ramps

The Beltline corridor study did not identify near-term solutions as part of the existing conditions analysis, and the need for both system and point improvements to address these deficiencies are being incorporated into the long-term corridor plan.

Recurrent Congestion Sites

In addition to the study intersections, several corridor segments were identified by City, County, and ODOT staff for consideration of treatment options within the future conditions analysis. These corridors are identified as Congestion Management Corridors within TransPlan.

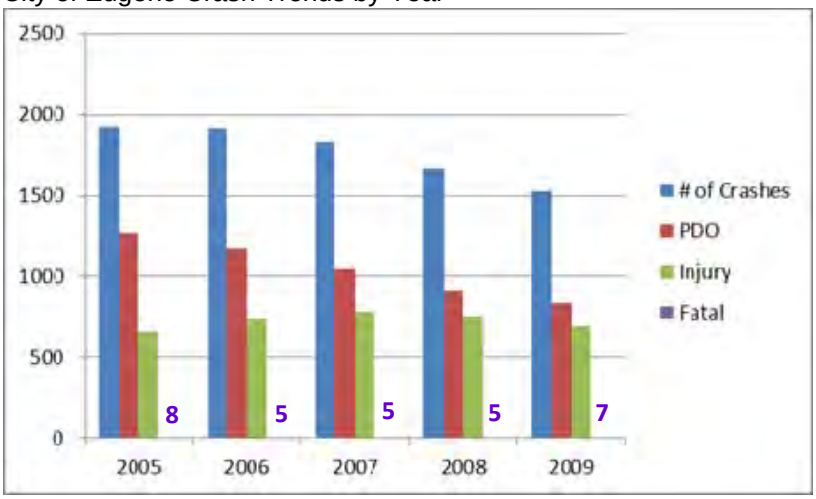
1. Interstate 5, from OR 58 interchange at Goshen to north boundary of the Transportation Management Area (TMA) at Coburg Road
2. OR 126/I-105, from Garfield Street in Eugene to Main Street/McKenzie Highway in Springfield
    a. 6th-7th couplet from Garfield to Jefferson
    b. Washington-Jefferson Bridge (I-105) from 7th to Delta Highway
    c. I-105 from Delta Highway to Interstate 5
    d. Eugene-Springfield Highway from I-5 to Main Street/McKenzie Highway
3. Beltline Highway, from Highway 99 to Interstate 5
4. Main Street/McKenzie Highway, from Mill Street (downtown Springfield) to 70th Street
    a. Broadway/Franklin Boulevard, from Mill St. (Eugene) to Springfield Bridge
    b. Broadway from Mill St. to Alder St.
    c. Franklin Boulevard from Alder St. to I-5
    d. Franklin Boulevard from I-5 to Springfield Bridge
5. West 11th Avenue, from Terry Street to Chambers Street
6. Ferry Street Bridge/Coburg Road, from Broadway to Crescent Avenue
7. Southeast Eugene corridor (Hilyard-Patterson-Amazon Parkway-Willamette) from 13th to 33rd Avenue
8. 18th Avenue, from Bertelsen Road to Agate Street

Streets with capacity constraints today and in the future are shown in Figure 9.

Safety Analysis

Crash records were obtained throughout the City of Eugene to identify regional crash trends that may be addressed through engineering, education, and enforcement strategies. Reportable crashes are those that result in an injury or fatality or result in over $1,500 in vehicle or property damage. The graph below illustrates the number of crashes by year, and highlights a decrease in total collisions, with reported 2009 crashes 79 percent of the level experienced in 2005. Between five and eight fatal crashes have been reported per year. Fatal crashes represent 0.3 percent of all crashes within the City, injury crashes represent less than 41 percent of all crashes, and non-injury (property damage only, PDO) crashes represent about 59 percent of the total.

City of Eugene Crash Trends by Year



Review of weather and roadway surface conditions showed that of the total crashes, approximately 75 percent occur during clear weather with dry roadway conditions, approximately 7 percent occur during cloudy weather, and 16 percent occur during rainy conditions (20 percent with wet roadways). Approximately 2 percent of the crashes occurred during snow/ice, foggy, or unknown conditions.

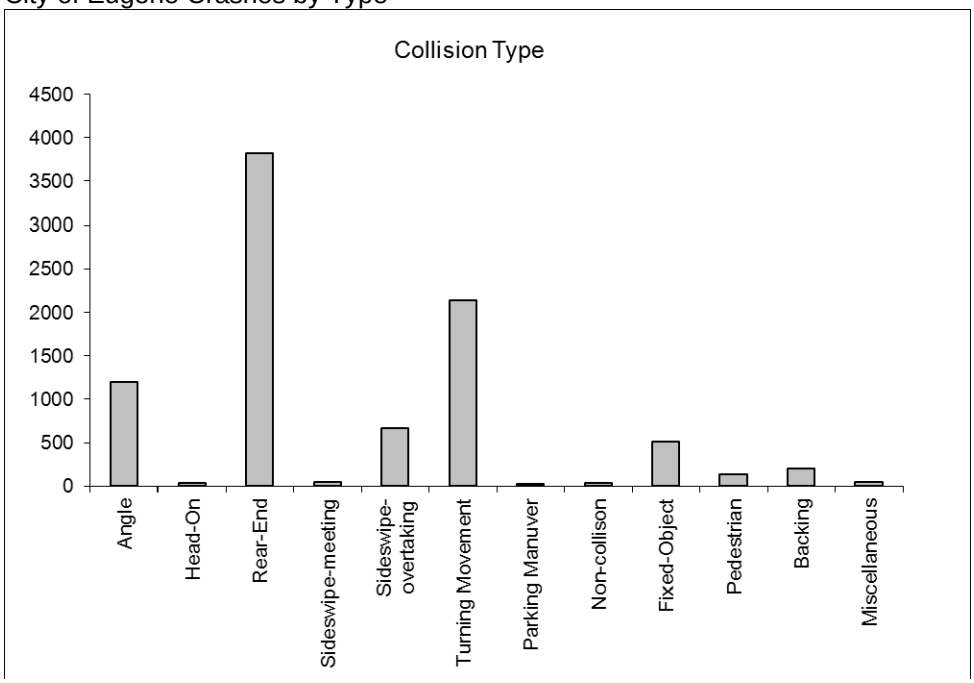
Following volume trends throughout the day, about three in four collisions occur in daylight, one in five crashes occur in the dark, and one in twenty crashes occur during either dusk or dawn.

The graph on the following page illustrates the types of collisions that have occurred throughout the City. Overall, all types of collisions have declined throughout the five-year period, with the smallest reduction in crashes associated with turning movement crashes. Pedestrian-involved crashes (grouped with bicyclist crashes) have declined from 37 crashes in 2005 to 20 crashes in 2009 following an annually declining pattern.

Day of week trends show that crash frequencies increase through the week, with crashes on Monday representing 15 percent of the total and crashes on Friday representing 19 percent of the total. Weekend crashes comprise 18 percent of the total, with Sunday representing 8 percent of the overall crashes. Crashes by time of day follow volume trends, with a gradual

increasing trend through the morning and a peak during the evening commute period. Following the peak volume trends, crashes drop off significantly into the evening.

City of Eugene Crashes by Type



Intersection Crash Rates

Intersection crash rates were reviewed to provide an overall screening of the safety at the study intersections. The crash rates were developed based on crash data provided by ODOT for each of the study intersections, and annual volumes were approximated from the commute period turning movement counts and roadway tube data. The total crash experience was taken directly from queries of the Statewide crash database without further screening of the individual records, and as such provides a conservatively high estimate of the crash experience. The resultant rates are shown in Table 4 and displayed in Figure 10. For the initial screening, a crash rate higher than 1.0 was considered to be an indicator of potential geometric or operational deficiencies. Intersections experiencing a crash rate higher than this were reviewed in greater detail to identify any discernable trends. In addition, any study intersection experiencing a fatality was also reviewed.

TABLE 4
Intersection Crash Rates

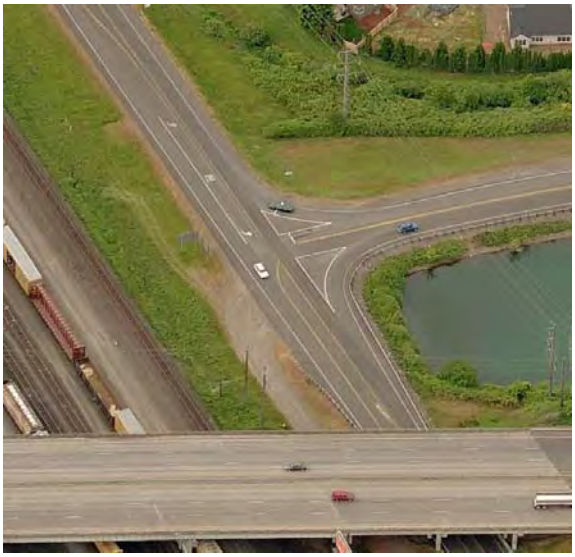
MEV: Million Entering Vehicles
Crash Rate: Crashes per Million Entering Vehicles
[1]Further review of crashes at these locations resulted in a number of crashes that were not intersection-related (i.e., occurring at adjacent intersections, etc). The reported crash rate reflects the adjustment.
[2]Crash records included a fatal collision

As shown in Table 4, thirteen of the study intersections experienced a crash rate of 1.0 or greater between 2005 and 2009. In reviewing the individual intersection crash records it was noted that the collision records summarized for individual intersections also included crashes at driveways and in some cases closely spaced public streets in proximity to the intersection. In addition, crashes that occurred away from intersections may have been excluded, such as the area of Delta Highway near the Randy Papé Beltline interchange where long queues and geometric conditions result in frequent collisions. Further review at each of these locations is provided below.

Intersection 1, 2. Randy Papé Beltline Ramps/Northwest Expressway

The image to the right shows the current intersection configuration. As discussed above, the operations analysis identified the stop-controlled westbound approach operating at-capacity and at LOS "F". Although left-turn delays are high during the peak periods, the left-demand is low likely as a result of drivers choosing alternative routes to avoid the delays.



Aerial view of the Randy Papé Beltline Westbound Ramp intersection with Northwest Expressway.

Review of the crash records identified a total of 53 crashes throughout the five year period at the interchange terminals, with 25 crashes on the eastbound terminal. Injury crashes comprise approximately 43 percent of all crashes at the interchange terminals.

Citywide, approximately 25 percent of crashes have occurred during inclement weather, such as rain, snow, etc. At the ramp terminal intersections, approximately 44 percent of crashes have occurred on wet pavement. In addition, approximately 40 percent of all reported crashes occurred in poorly lit or dark conditions, which is much higher than citywide trends.

This data suggests that inclement weather and the lack of illumination may be affecting visibility. In addition, as discussed in the operations review, due to the high volume of through traffic there are limited gaps in traffic for vehicles to turn from the ramp onto Northwest Expressway. The crash experience suggests that vehicles may be accepting shorter gaps than are necessary to safely maneuver into the through traffic, especially during inclement weather conditions. Intersection improvements should consider both the operational and safety needs.

The one fatality within the crash records occurred in December 2007 and was reported as a single vehicle collision. Further review of the database revealed that the crash occurred on the Randy Papé Beltline mainline east of the diverge point for the westbound off-ramp. Accordingly, the fatal crash was not associated with the interchange ramps.

Intersection 11. Highway 99W/Roosevelt Boulevard

At the Highway 99W intersection with Roosevelt Boulevard intersection, 83 crashes were reported during the past five years, with 53 percent of the crashes reported as injury crashes. Yearly crash experience has been relatively constant throughout this period, with rear-end and turning movement crashes comprising three-quarters of all reported collisions. Of the reported rear-end collisions, approximately 46 percent are associated with northbound vehicles, approximately 34 percent are associated with southbound vehicles, and the remainder are associated with eastbound or westbound vehicles. Two of the crashes at this intersection involved a pedestrian, both of which were classified as injury crashes. Review of the crash data did not identify any specific patterns or trends.

Geometric review of the intersection identified that the intersection is skewed at an approximately 30 degree angle, with channelized right-turn islands to provide an adequate turning radius on the southeast and northwest quadrants. Separate left-turn lanes are in place and provide protected signal phasing on all approaches. Private driveways are located within close proximity to the intersection, though the crash records show only two collisions that were recorded as driveway-related.

The City of Eugene has reviewed improvement options at this intersection to increase driver awareness on the northbound approach, where the majority of the rear-end crashes have occurred. The railroad overcrossing limits the available sight distance toward the back of queue on the northbound approach, so an overhead flashing warning sign was identified as the recommended mitigation. No funding has yet been secured for this improvement.

Intersection 13. River Road/Irving Street – Hunsaker Lane

There were 71 reported crashes at the River Road/Irving Street intersection throughout the five year analysis. Ninety-percent of the reported crashes were either rear-end (52 percent) or turning movements (38 percent), and one-third of the reported crashes resulted in injuries.

Review of the crash records identified two pedestrian crashes that occurred within the intersection on the westbound exiting lane, one in September 2008 and one in August 2009. In the 2009 crash there were two pedestrians struck by a southbound right-turning vehicle. The crash records cited failure to yield right-of-way. The 2008 crash was coded as the fault of the pedestrian at an illegal crossing location.

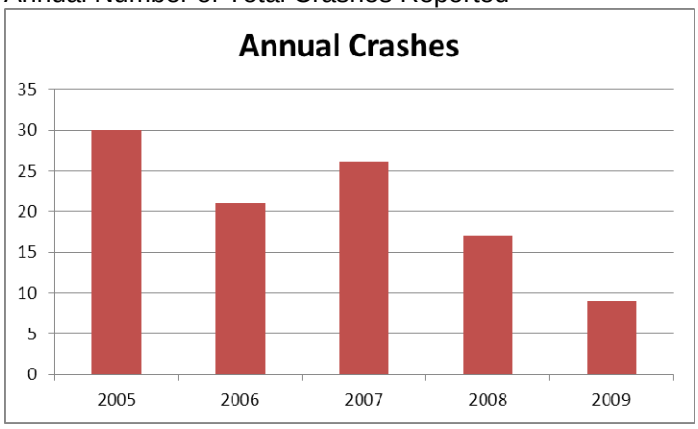
The current signal timing includes protected and permissive phasing on the north-south approaches and permissive-only phasing east-west. The majority of crashes were reported on the higher-volume north-south approaches, though based on the volumes rear-end crashes on the eastbound approach appear to be over-represented within the crash records, which could be attributable to the straight uncontrolled roadway section prior to the signal and numerous private access driveways within the signal influence area. Nearly all of the turning crashes involved north-south through traffic, and the northbound left-turn was the predominant movement.

Potential improvement options include replacement of the five-section north-south signal displays with four-section flashing yellow arrow signal displays, installation of signal ahead signage, and consideration of median treatments to reduce turning movements adjacent to the traffic signal.

Intersection 16. Bailey Hill Road/W 11th Avenue

A total of 103 crashes were reported at this intersection during the five year period, with one crash reported as drug and alcohol related and 32 reported due to excessive speed. Crashes at the intersection have been declining since their peak of 30 crashes in 2005 to only 9 crashes in 2009. Of the reported crashes 60 (58 percent) were non-injury collisions. Over half of the reported crashes (58 of 103 total crashes) were classified as rear-end collisions. The other reported collision types were turning movement (30), angle (7), sideswipe (5), fixed-object (2), and miscellaneous (1). Of the 103 reported crashes only 20 were reported to occur within the intersection; it is unclear what percentage of the crashes occurred at nearby private driveways. Sight distance limitations were observed from private driveways north of the intersection along Bailey Hill Road due to the crest vertical curve.

Annual Number of Total Crashes Reported



Intersection 17. Seneca Road/W 11th Avenue

A total of 62 crashes were reported at this signalized "T" intersection during the period from 2005 to 2009. Of these collisions 27 resulted in injuries. The majority of crashes were categorized as either turning movement (30) or rear-end (26) collisions. Turning movement crashes have declined since their peak in 2005 with 10 reported crashes to only three crashes in 2008 and 2009. There was one pedestrian crash reported; the collision occurred in April

2008 approximately 200 feet west of the intersection. Annual crashes at the Seneca Road and W 11th Avenue intersection have been declining with 17 reported crashes in 2005 and only 6 in 2009.

Field review of the intersection identified a closely spaced public road (Buck Street) to the east of the intersection forming an offset "T" and stop-controlled northbound leg. Buck Street serves multiple businesses. It is recommended that the City look for opportunities to realign this road with the signal, further offset the intersection, consider access restrictions and/or channelization, or look for opportunities to close the access with provision of shared access easements to adjoining parcels. These strategies could help to avoid conflicts between access needs and signalized intersection operations. Based on the declining crash trends it is also recommended that the intersection continue to be monitored.

Intersection 18. Garfield Street & W 11th Avenue

A total of 66 crashes were reported at the intersection over the period analyzed. Of these, 50 were classified as non-injury crashes. Over half of the crashes were classified as rear-end collisions, with the vast majority occurring eastbound and westbound on W 11th Avenue. No other significant trends were observed at this location.

Intersection 20. Garfield Street/W 13th Avenue

The unsignalized intersection of Garfield Street and W 13th Avenue is unconventionally configured to allow free-flow conditions for the higher volume southbound movement. The intersection contains extensive signs warning drivers of the transition from a southbound to eastbound (one-way) alignment.

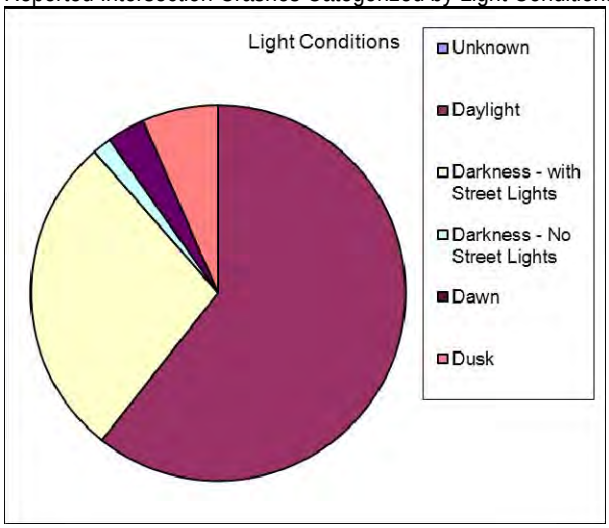
Crash records identify a total of 27 crashes, though the annual crashes have been declining. Three-quarters of the reported crashes result in property damage only, likely reflective of the lower severity rear-end crash type comprising a majority (67 percent) of the reported crashes. The high occurrence of rear-end crashes is likely associated with the unconventional intersection configuration. The intersection currently exceeds performance thresholds due to high delay experience on the low-volume eastbound approach. It is recommended that the City consider reconfiguration of the intersection to a more conventional form that better meets driver expectations.

Intersection 21. Chambers Street/W 13th Avenue

The intersection of Chambers Street and W 13th Avenue shows an over-representation of crashes during non-daylight periods with 40 percent of the total reported collisions during periods of low light as compared to a citywide average of approximately 25 percent. Overhead intersection illumination is present on the northeast and southwest quadrants with cobrahead-style fixtures. Field observations noted that although the intersecting roadways are perpendicular, the signal visibility is reduced due to vegetation overhanging the street. In addition, the dark background when viewing the signals from surrounding trees and low lumens from the signals further reduces their visibility. Potential improvements could include higher visibility backplates (such as a yellow border), higher intensity signal lamps, and pruning along W 13th Avenue. This is likely to be an issue beyond this single intersection, as street trees and vegetation are prevalent along many City

corridors. Due to the location of the intersection within a school zone additional illumination may also be considered if these measures are not adequate.

Reported Intersection Crashes Categorized by Light Conditions



Turning movement crashes comprise 20 percent of the overall total crashes at this intersection. Today, permissive-only left-turn signal phasing is provided at the intersection. Based on the high through volume in the northbound direction, it is recommended that the City consider protected and permissive signal phasing for the southbound to eastbound maneuver. The protected and permissive phasing will allow the signal to operate with protected only phasing during the peak periods and permissive phasing during off-peak periods to reduce unnecessary delay.

Intersection 22. Chambers Street/W 18th Avenue

Annual crashes at Chambers Street and W 18th Avenue were declining from 2005 (18 crashes) through 2008 (8 crashes) but again increased in 2009 (18 crashes), which could be related to the construction of new businesses and increased traffic to these new generators. Crash patterns were reviewed at the intersection based on this increasing trend despite the crash rate remaining below 1.0 per million entering vehicles. Review of the crashes showed that the occurrence generally followed regional trends related to traffic flows, weather, and severity.

Field review of the intersection noted a number of commercial driveways surrounding the intersection (see photo below). Based on the available information within the ODOT crash database it is difficult to ascertain the specific location of a crash. Nearly three quarters of all reported crashes occurred outside of the intersection; it is likely that ten crashes were associated with private driveways.

Private access driveways onto W 18th Avenue.

There were three reported pedestrian crashes, including two in 2005 and one in December 2009, all of which were classified as injury crashes. One of the crashes occurred within the intersection and two crashes occurred mid-block. The mid-block crashes occurred adjacent to the mid-block transit stop.

The land uses surrounding the intersection were likely constructed prior to current frontage standards so it is recommended that the City work with property owners over time to evaluate site frontage standards and site layout improvements that consolidate access and better orient pedestrians toward the signalized or existing grade separated crossings. It is also recommended that consideration be given to relocating the bus stops to far side of the intersection to facilitate ease of crossing.

Intersection 28. Willamette Street/W 29th Avenue

Crash records identify a total of 66 crashes throughout the 2005 through 2009 analysis period at the Willamette Street and W 29th Avenue intersection, representing a crash rate of 1.40.

Review of the crash patterns identified an over-representation of turning crashes at the intersection. These crashes represented 53 percent of the overall crashes and exhibit an increasing trend throughout the analysis period. Review of the crash database showed that only 16 of the 66 reported crashes occurred within the intersection, indicating that a high number of crashes could be associated with adjacent commercial driveways.

No other crash patterns or geometric deficiencies were noted based on review of the crash trends.

Intersection 36. Coburg Road/Crescent Avenue

There were 52 reported crashes at the Coburg Road and Crescent Avenue intersection within the five year assessment period, with 24 of these crashes resulting in injuries. Half of the collisions were classified as rear-end crashes. A single pedestrian crash was reported in September 2005, and was reported as occurring 40 feet from the intersection. The occurrence was reported to be an injury crash.

Review of the crashes by time of day, weather and road surface conditions, day of week, crash type, lighting conditions, and annual occurrence did not identify any patterns within the crash data. Due to the high number of rear end collisions, treatment options could include the addition of a second through signal display and replacement of the five-section protected and permissive heads with flashing yellow arrows, increased visibility signal heads, and review of intersection approach signs.

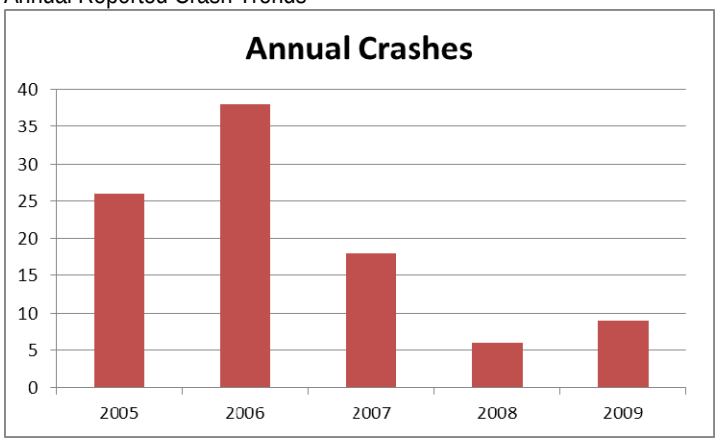
Intersection 43. Delta Highway & Willagillespie Road

A total of 31 crashes were reported at this intersection over the period analyzed. Of these, 14 were classified as injury crashes. Over half of the reported crashes were reported to be rear-end collisions, of which most occurred in the northbound direction on Willagillespie Road, despite the signal at Valley River Drive located immediately south. No other significant trends were observed at this location.

Intersection 49. Jefferson Street/W 7th Avenue

Review and screening of the reported crashes at Jefferson Street and W 7th Avenue identified 107 crashes associated with the intersection, resulting in a crash rate of 1.46 crashes per million entering vehicles. Forty-seven of the reported crashes resulted in injuries. Annual review of the crashes identified significantly higher crash frequency in 2005, 2006, and 2007. Rear-end crashes were the most prevalent crash type, comprising 43 percent of the overall crashes. No patterns were identified through review of crashes by illumination, weather, road surface conditions, time of day, or day of week.

Annual Reported Crash Trends



Field observations at the intersection noted that the volume of traffic in conjunction with the dense vehicle platoons from the signalized intersections makes lane change maneuvers difficult along W 7th Avenue. The crash records cited excessive speeds as a contributing factor in a majority of the crashes. The City should consider a review of the intersection yellow and all-red signal timing to ensure adequate clearance intervals are provided.

Intersection 50. Washington Street/W 7th Avenue

Ninety-seven collisions were reported at the intersection of Washington Street and W 7th Avenue, resulting in a crash rate of 1.39. Review of these crashes highlights a sharp decrease

in the number of crashes recorded annually since 2006; there were 38 crashes in 2006, 18 in 2007, 6 in 2008, and 9 in 2009.

Existing signage at the Washington Street and 7th Avenue intersection.

Crashes at the intersection were more likely to occur during rainy conditions as compared to overall City averages, with 35 percent of the crashes on wet pavement. Fixed object crashes were over-represented at the intersection comprising 18 percent (17 in total) collisions over the five-year period, which is unusually high for crashes at an urban intersection. Fixed-object crashes typically comprise less than five percent of all crashes at conventional intersections. A more detailed review of the fixed object crash records indicate that 8 vehicles collided with a guard rail, 4 collided with a median barrier, 4 collided with bridge railing, and 1 collided with the curb as well as a nearby fence or building. The high occurrence of these crashes could be attributed to driver confusion associated with the parallel northern routes (to I-105 and Washington Street) and one-way streets. The higher proportion of crashes during rainy weather could also be attributable to driver confusion and unclear wayfinding direction.

Based on a field review of the intersection it is recommended that the City review signing and striping treatments at the intersection (and west through the Jefferson Street and 7th Avenue signal) to provide a clear and simple message to motorists. Consideration should also be provided to raised pavement markings, lane extension lines, and higher visibility treatments along the channelized islands and median curbing. This may help reduce fixed-object crashes due to the atypical configuration. However, it is likely that fixed object crashes will continue to be over-represented regardless of the treatments provided.

Beltline Highway Safety Review

Review of the Beltline Highway study identified numerous crashes along the highway, with the majority of crashes reported within the vicinity of interchanges. Further, many of the crashes along the highway occurred during the morning and evening commute periods, when traffic volumes and congestion levels tend to be higher. In particular, the crash rate and frequency were the highest near the Delta Highway and River Road Interchanges. These two locations account for nearly 70 percent of all recorded crashes during the period measured. In addition to a high percentage of rear end crashes, a number of crashes occurred in which vehicles ran off the road or were involved in a sideswipe.

Per information obtained from ODOT, the average crash rate measured at similar facilities (i.e., "other freeways and expressways") in the year 2007 was 0.73 crashes per million vehicle miles (MVM). The crash rate measured for the segment of Beltline Highway between River Road and Delta Highway is higher than the statewide average with a rate of 1.16.

Between Delta Highway and Coburg Road, the measured crash rate is lower than the statewide average.

Fatalities

Review of the crash database identified thirty fatalities throughout Eugene over the five-year analysis period. The fatal crashes were relatively constant throughout this period, with five to eight crashes per year. In addition to the fatalities previously described, there were four other study intersections with fatal crashes. Review of the records showed that these were isolated incidents; two involved drugs or alcohol, one involved an illegal mid-block pedestrian crossing within proximity of a marked crosswalk, and one was a random event that was caused by a pet running into traffic.

Corridor Safety Needs

A qualitative review of crash history at intersections and along corridors beyond the study intersections was also performed. This evaluation included a review of roadways where the recorded crash density was unusually high, with no weighting provided to traffic volumes. The following corridors were identified as candidates for further safety review, in order of priority:

- Delta Highway (Good Pasture Island Road to Green Acres Road),
- Coburg Road (E 6th Avenue to Oakway Road), and
- River Road (Maxwell to Irving).

In addition to these corridors, the following intersections are also recommended for further safety review:

- Coburg Road/Willakenzie Road
- River Road/River Avenue

Pedestrian System

Pedestrian Facility Types

According to the Oregon Bicycle and Pedestrian Plan (OBPP), pedestrian facilities are defined as any facilities utilized by a pedestrian or persons in wheelchairs. These types of facilities include walkways, traffic signals, crosswalks, curb ramps, and other features such as illumination or benches.

The following types of pedestrian facilities are recognized by the American Association of State Highway and Transportation Officials (AASHTO) and the OBPP unless otherwise noted:

- **Sidewalks:** Sidewalks are located along roadways, are separated from the roadway with a curb and/or planting strip, and have a hard, smooth surface, such as concrete. The ODOT standard for sidewalk travelway width is six feet, with a minimum travelway width of five feet acceptable on local streets. The unobstructed travelway for pedestrians

should be clear of utility poles, sign posts, fire hydrants, vegetation, and other site furnishings.

- **Shared-use paths:** Shared-use paths are used by a variety of non-motorized users, including pedestrians, cyclists, skaters, and runners. Shared-use paths are typically paved (asphalt or concrete) but may also consist of an unpaved smooth surface as long as it meets Americans with Disabilities Act (ADA) standards. Shared-use paths are usually wider than an average sidewalk (i.e. 10 – 14 feet).
- **Roadway Shoulders:** Roadway shoulders often serve as pedestrian routes in many rural Oregon communities. On roadways with low traffic volumes (i.e., less than 3,000 vehicles per day), roadway shoulders are often adequate for pedestrian travel. These roadways should have shoulders wide enough so that both pedestrians and bicyclists can use them, usually six feet or greater.
- **Accessways:** Not defined in the OBPP, accessways are short sidewalk or shared-use path segments providing direct pedestrian and bicycle connections to destinations that would otherwise require out-of-direction travel on the surrounding street system. Accessways commonly connect cul-de-sac streets with paths, schools, or nearby streets to minimize pedestrian and bicycle travel distance in areas with limited street system connectivity.

Figure 11 shows existing sidewalks, shared-use paths, and accessways in Eugene. The percentage of streets classified as arterials or collectors that have sidewalks is 69% (252 of 366 miles); this figure does not include limited access freeways such as Randy Papé Beltline and I-105.[8]

Sidewalk coverage is one way to track how well a city's roadway system serves pedestrians, and can be a useful metric to track over time to demonstrate if or how sidewalk coverage is improving through new projects. Identified gaps in the arterial and collector sidewalk network will be used in developing projects for the future proposed pedestrian system in Eugene. The percentage of roadway miles with sidewalks is also a stated performance measure in TransPlan and is intended to be tracked over time.

Existing Pedestrian Facilities and Conditions

The City of Eugene was divided into five (5) geographic areas for the purposes of the pedestrian system assessment. These areas were also used for the land use analysis and are depicted in Figures 4a – 4e.

Central Eugene

Central Eugene's traditional grid street network creates a comfortable walking environment. Streets have near-universal sidewalk coverage, with good provision of curb ramps and marked crosswalks, serving a variety of primary pedestrian destinations such as the University of Oregon, downtown shops and workplaces, the University District, the Eugene Public Library, the Lane Transit District (LTD) Eugene Station, the Farmer's Market and

[8] 100% sidewalk coverage would mean full buildout of sidewalks on both sides of the street; a sidewalk on one side only would result in 50% sidewalk coverage for that facility.

Saturday Market, and parks such as Skinner Butte Park, Alton Baker Park, and Amazon Park. Many downtown employees arrive to work by transit, bicycle, or car and then make daytime trips on foot, contributing to a lively midday urban environment.

The LTD Eugene Station in downtown is a destination for pedestrians.

Central Eugene is served to the north by the Ruth Bascom Riverbank Path System along the Willamette River, with primary access points at Agate Street, Hilyard Street, and at the Ferry Street Bridge. To the south, the Amazon Path begins at South Eugene High School and continues south to Amazon Parkway and Tugman Park. To the east, the Fern Ridge Path begins at Westmoreland Park and continues east to the city limits.

South Hills

This sector of Eugene features hilly topography and a non-grid street network, which create more challenging conditions for walking. Many roads in this part of Eugene were developed without sidewalks, and infill has been inconsistent, resulting in many roadways with no sidewalks or sidewalks on only one side of the street. Curb ramps and marked crosswalks are largely absent from this part of Eugene. Other through streets have sidewalks on one side only (e.g., Willamette Street and Fox Hollow Road). Certain pockets of residences, such as areas surrounding Friendly Street south of E 28th Avenue and surrounding Timberline Drive, have no sidewalks. It can be difficult to access some neighborhoods in the South Hills, such as Laurel Hill Valley, because of steep hills and a lack of walking facilities and connected streets.

Many roads in Eugene's South Hills lack sidewalks on one or both sides.

Because much of Eugene's South Hills are primarily residential, with few commercial destinations, pedestrian destinations in this part of town are primarily area schools, parks (such as Hendricks Park and Spencer Butte), and the soft-surface Ribbon Trail and Ridgeline Trail. The Amazon and Rexius Paths provide an important northbound route into and out of the South Hills.

West Eugene/Bethel/Danebo

West Eugene has flat topography that facilitates walking, but the development patterns have left a legacy of cul-de-sac housing developments, disconnected streets, and high-speed/high-volume thoroughfares that make walking challenging and, in many cases, unpleasant. This sector of Eugene is bounded by Highway 99, the rail yards, and the Northwest Expressway along the northeastern border, presenting a largely impassable barrier to pedestrian travel into and out of the area. In addition, Randy Papé Beltline

presents a major pedestrian barrier within the sector. The industrial area south of Roosevelt also presents challenges to pedestrians, as the roadway network breaks down and through trips are necessarily channeled to major streets.

The Fern Ridge Path is the premier walking facility in West Eugene.

There are businesses that can serve as pedestrian destinations, but because these businesses are located along major streets and have an auto-oriented configuration, with large parking lots, significant setbacks, and large driveways, pedestrian traffic is lower than it might otherwise be. Primary pedestrian destinations in this part of Eugene include neighborhood schools and parks, the Bethel Branch Library, and parks and wilderness areas on the edge of the city (such as Meadowlark Prairie and Golden Gardens Park).

Many local streets in this sector of Eugene are missing sidewalks entirely, or have inconsistent sidewalk coverage, and many sidewalks do not have curb ramps. Certain residential developments (e.g., the area east of N Terry Street between Barger Drive and Royal Avenue) lack sidewalks entirely, and have no pedestrian connections between cul-de-sac streets.

River Road/Santa Clara

Like West Eugene, River Road/Santa Clara's flat topography is not challenging for walking. The defining factor for pedestrians in this part of town is the legacy of patchy, often lot-by-lot incorporation, leaving many roads in this part of town outside of city control and thus not subject to city standards. As a result, River Road/Santa Clara has the lowest percentage of streets served by sidewalks in Eugene, and where there are sidewalks they are in many cases narrow, curb-tight, and lacking curb ramps. Many major streets (such as Hunsaker Lane, River Loop 1, River Loop 2, and Scenic Drive) are missing sidewalks, and nearly all of the River Road neighborhood (south of Randy Papé Beltline) lacks sidewalks entirely.

Lack of sidewalks in the River Road/Santa Clara neighborhoods force pedestrians to use the street.

Along with missing and substandard pedestrian infrastructure, walking is made more difficult by a non-grid roadway network. In order to travel a reasonable distance, most pedestrians will have to either make numerous dog-leg turns or use major roadways.

This sector of Eugene is bounded to the west by NW Expressway and to the east by the Willamette River, with Randy Papé Beltline providing the major crossing opportunity for vehicles and providing no accommodation for foot traffic. Randy Papé Beltline also represents a significant pedestrian barrier within the River Road/Santa Clara sector, and can only be crossed at River Road, a five-lane high-volume/high-speed arterial. Area

residents report that the quantity and quality of pedestrian crossing opportunities across River Road leaves much to be desired.

Beyond neighborhood parks and schools, the Ruth Bascom Riverbank Path System is the premier pedestrian facility for this part of town. Most roadways east of River Road and south of Randy Papé Beltline have at least some form of access to the path system, though many are unimproved "demand trails" (worn tracks in dirt showing where people access the path despite lack of a formal access point). Formal pathway access is provided at several locations (including River Avenue, Howard Avenue, and Hillcrest Drive). The Ossowo and Greenway Bike bridges enhance the value of the riverfront paths for River Road/Santa Clara residents by giving them pedestrian access to the Ruth Bascom Riverbank Path System and the Willakenzie/Ferry Street Bridge neighborhoods.

NE Eugene-Willakenzie/Ferry Street Bridge

This sector of Eugene is bounded to the east by I-5, limiting pedestrian access to Springfield to few crossings (such as the I-5 Bike Bridge, Harlow Road, and Martin Luther King Jr. Boulevard). The Willamette River surrounds this part of Eugene to the south and west, representing both a barrier and a resource for foot trips by means of the path network.

Pedestrian accessways connect some streets in this part of Eugene.

While more roadways have sidewalks than in River Road/Santa Clara, there are numerous local roadways that lack sidewalks and curb ramps or provide inconsistent or substandard pedestrian accommodation. Many lower-traffic streets do not connect to other lower-traffic streets, forcing pedestrians to use busier streets for longer trips. At numerous locations in this part of Eugene, pedestrian accessways between dead-end streets provide a convenient solution to the problem of disconnected streets, offering shorter trip distances for walkers and an alternative to using major streets.

Randy Papé Beltline and I-105 traverse the NE Eugene-Willakenzie/Ferry Street Bridge neighborhood and are barriers to foot traffic. In addition, a number of large land uses such as Autzen Stadium and the Eugene Country Club provide no pedestrian through access, again forcing residents to make longer trips on busier streets.

Coburg Road is the most prominent of a number of major high-speed arterials that carry large amounts of both local and through motor vehicle traffic. While Coburg Road offers pedestrians a complete sidewalk network, signalized crossing opportunities, and commercial destinations, many residents report that it is uncomfortable for pedestrians, particularly along segments that have curb-tight sidewalks (that is, with no parking or landscaped buffer between pedestrians and the street).

Major pedestrian destinations in this sector of Eugene include the Sheldon Branch Library, the Sheldon Sports Park, the Sheldon Community Center and Pool, and retail and service opportunities at shopping centers (Oakway Center, Delta Oaks, and Valley River Center)

and along Coburg Road and Green Acres Road. During sporting events, Autzen Stadium also attracts a large number of pedestrian trips.

This part of Eugene has numerous pedestrian access points to the Ruth Bascom Riverbank Path System, including the Green Acres Road path north of the Ossowo Bike Bridge, the Delta Ponds bridge (currently under construction), several connections from Goodpasture Island Road, the Ferry Street Bridge from Coburg Road, and several access points through Alton Baker Park.

Bicycle System

Bicycle Facility Types

Bikeways are distinguished as preferential roadways that have facilities to accommodate bicycles.

According to AASHTO's Guide for the Development of Bicycle Facilities (1999) and the OBPP, there are several different types of bicycle facilities. Bicycles are allowed on all study area roadways.

The following types of bikeways are recognized by AASHTO and OBPP:

- **Shared Roadway / Signed Shared Roadway:** Shared roadways include roadways on which bicyclists and motorists share the same travel lane. This is the most common type of bikeway. The most suitable roadways for shared bicycle use are those with low speeds (25 mph or less) or low traffic volumes (3,000 vehicles per day or fewer). Signed shared roadways are shared roadways that are designated and signed as bicycle routes and serve to provide continuity to other bicycle facilities (i.e., bicycle lanes) or designate a preferred route through the community. Common practice is to sign the route with standard Manual on Uniform Traffic Control Devices (MUTCD) green bicycle route signs with directional arrows. The OBPP recommends against the use of bike route signs if they do not have directional arrows and/or information accompanying them. Signed shared roadways can also be signed with innovative signing that highlights a special touring route (i.e., Oregon Coast Bike Route) or provides directional information in bicycling minutes or distance (e.g., "Library, 3 minutes, 1/2 mile").
- **Shoulder Bikeway:** These are paved roadways that have striped shoulders wide enough for bicycle travel. ODOT recommends a six-foot paved shoulder to adequately provide for bicyclists, and a four-foot minimum in constrained areas. Roadways with shoulders less than four feet are considered shared roadways. Sometimes shoulder bikeways are signed to alert motorists to expect bicycle travel along the roadway.
- **Bike Lane:** Bike lanes are portions of the roadway designated specifically for bicycle travel via a striped lane and pavement stencils. ODOT *standard* width for a bicycle lane is six feet. The *minimum* width of a bicycle lane against a curb or adjacent to a parking lane is five feet. A bicycle lane may be as narrow as four feet, but only in very constrained situations. Bike lanes are most appropriate on arterials and major collectors where high traffic volumes and speeds warrant greater separation.
- **Shared-Use Path:** Shared-use paths are used by a variety of non-motorized users, including pedestrians, cyclists, skaters, and runners. Shared-use paths may be paved or

unpaved, and are often wider than an average sidewalk (i.e. 10 – 14 feet). In rare circumstances where peak traffic is expected to be low, pedestrian traffic is not expected to be more than occasional, good passing opportunities can be provided, AND maintenance vehicle loads are not expected to damage pavement, the width may be reduced to as little as 8 feet.

In addition, **bicycle boulevards** are an increasingly common bicycle facility type. Though they have not yet been formally recognized by AASHTO and the OBPP, they have been defined as low speed, low volume local streets that have been optimized for bicycle travel through treatments such as traffic calming and traffic reduction, signs, pavement markings and intersection crossing treatments. The intent of this treatment is to provide direct, safe, comfortable and attractive routes that are welcoming to cyclists of all ages and skill levels.[9] In Eugene, Alder Street, E 15th Avenue, and Monroe Street/Friendly Street have not been formally designated as bicycle boulevards, but they effectively function as bicycle boulevards due to traffic calming, traffic reduction, signs, pavement markings, and crossing treatments.
Figure 12 shows existing bikeways, shared-use paths, and accessways in Eugene. Bicycle boulevards are not shown separately because no formal bicycle boulevards have been designated in Eugene at present.

The total number of miles of bikeway in Eugene is 220 miles (116 miles of bike lanes, 52 miles of signed bikeways, and 52 miles of shared-use paths). Approximately 45% of Eugene's arterials and collectors are served by bike lanes. Identified gaps in the arterial and collector bikeway network will be used in developing projects for the future proposed bicycle system in Eugene.

Existing Bicycle Facilities and Conditions

The City of Eugene was divided into five (5) geographic areas for the purposes of the bicycle system assessment. These areas were also used for the land use analysis and are depicted in Figures 4a – 4e.

Since the 1970s, Eugene has made a serious effort to improve bicycling conditions through planning and implementing facilities. As a result, conditions in Eugene are generally far superior to most American cities, and the 10.8% bicycling commute mode share reflects the results.

Central Eugene

Residents traveling by bicycle in central Eugene benefit from generally favorable bicycling conditions. While traffic volumes in the downtown core can be intimidating to less-experienced bicyclists, traffic speeds are lower than on larger suburban roadways. The presence of many bicyclists (especially traveling to and from the University) results in a sense of "safety in numbers."

Traffic calming on some streets in Central Eugene results in a more comfortable bicycling experience.

[9] Source: National Association of City Transportation Officials' Cities for Cycling web page

Just as a grid makes for direct walking trips, residents traveling by bicycle in downtown Eugene and surrounding neighborhoods will be able to make a direct trip and choose from a variety of streets to meet their needs. Downtown's workplaces, shops and services attract a large number of bicycle trips, as do the Ruth Bascom Riverbank Path System and the University of Oregon campus.

Downtown features numerous bike lanes, some of which are left-running or contra flow lanes on one way streets. A number of streets have also been designated as signed bikeways (such as Broadway, 12th Avenue, and Olive Street), and sections of 10th Street, 12th Street, and Broadway additionally feature traffic diverters. Downtown does not have any fully separated path facilities for bicyclists. Despite the relatively high concentration of bikeways, many existing and potential bicyclists report that traffic speeds and volumes are too high for comfort, and they have requested bicycle facilities that provide more separation from vehicular traffic. While downtown Eugene offers bicyclists a relatively high number of sidewalk bike racks, residents report that there are insufficient numbers of covered, secure long-term bicycle parking facilities.

In the residential neighborhoods surrounding downtown, people traveling by bike may take bike lanes on busier streets (such as 18th Avenue, Agate Street, and E 24th Avenue) or opt for lower-traffic signed bike routes (e.g. Broadway, 15th Avenue, and University Street).

Bicyclists make use of the same shared-use paths as pedestrians: the Ruth Bascom Riverbank Path System, the Amazon Path, and the Fern Ridge Path. Bicyclists who want to travel to Springfield may take the pathway south of the Knickerbocker Bike Bridge, but a more popular route is to cross the bridge and head east on paths from Alton Baker Park.

South Hills

South of downtown and central Eugene, the South Hills rise sharply and challenge bicyclists with their steep slopes, non-grid street network, and sometimes fast-moving vehicle traffic. Many roadways have a rural cross-section of two lanes and minimal shoulders. Several roadways have been improved with bike lanes reaching at least partway into the hills (such as Timberline Drive, Hawkins Lane, Chambers Street, Amazon Parkway, and Fox Hollow Road), though many lack facilities that reach all the way to the city limits.

Many residents report that Willamette Street south of E 24th Avenue is uncomfortable for bicycling.

Aside from residents' trips, the major draw for bicyclists in the South Hills is access to outstanding recreational rides beyond the city limits (e.g. via Lorane Highway, Dillard Road, and Fox Hollow Road).

West Eugene/Bethel/Danebo

West Eugene's defining factor for both walking and bicycling is its disconnected street network. Eugene residents who bicycle in this part of town must use major streets to proceed in any direction (for example, only Barger Drive, Royal Avenue, and Roosevelt

Many roads in West Eugene, including S. Bertelsen Road, have bike lanes but also have busy vehicle conditions.

Boulevard cross Randy Papé Beltline). Highway 99, the rail yards, the NW Expressway, and the industrial area south of Bethel are all physical barriers that affect bicycling as well as walking.

Most major streets have bike lanes, though residents report that wide streets and higher auto speeds can make bike lanes uncomfortable, and major intersections (such as Barger Drive at Echo Hollow Road) can be particularly intimidating for left-turning bicyclists. A few streets have been designated as signed bicycle routes (e.g. Avalon Street and Fairfield Avenue), though they do not stretch long distances. Roosevelt Avenue also has a shared-use path on its north side that can be used by bicyclists.

Residents have several neighborhood destinations that can be accessed by bike (such as the Bethel Branch Library and numerous parks and natural areas). Many recreational bicyclists come through West Eugene to cross the city limits and continue west on longer rides. The Fern Ridge Path is popular and serves the majority of trips from these western neighborhoods to central Eugene.

River Road/Santa Clara

People traveling by bicycle in River Road/Santa Clara have only three streets with bike lanes available to them. Bike lanes on Maxwell Road and Irvington Drive travel east-west and connect to NW Expressway. River Road, the major north-south thoroughfare for all types of trips in this sector and the only existing opportunity to cross Randy Papé Beltline, has bike lanes along the entire length. Residents report that the five-lane cross section and heavy traffic makes for an uncomfortable bicycling environment.

River Road is a busy five-lane thoroughfare that carries most north-south bicycle trips in River Road/Santa Clara.

A few streets have additionally been designated as signed bike routes (e.g. River Loop 1, River Loop 2, Howard Avenue), but with no shoulders or traffic calming, they are more appropriate for experienced recreational cyclists than for inexperienced riders or children.

The Ruth Bascom Riverbank Path System is the major bicycling destination and circulator for this part of Eugene, and the Owosso and Greenway Bike bridges are important river crossing opportunities for eastbound cyclists and for

Lack of bike lanes on most streets in the River Road/Santa Clara area results in bicyclists traveling in the vehicle lane.

people who want to create routes of varying lengths on the path network.

NE Eugene-Willakenzie/Ferry Street Bridge

For bicyclists in this part of Eugene, limited crossing opportunities over I-5 and the Willamette River create significant barriers to travel of any distance. In addition, Randy Papé Beltline and I-105 are major barriers to north-south travel, and Autzen Stadium, the Oakway Golf Course, and the Eugene Country Club are large parcels that break up the street grid.

Alton Baker Park has parallel paved and soft-surface paths in many locations.

Disconnected local streets make it challenging to travel by bicycle without using major streets, though a handful of neighborhood accessways provide connectivity for bicyclists on low-traffic streets. A few signed bicycle routes have been developed to offer an alternative to major roadways (e.g. Sorrel Way/Westward Ho Avenue), and there are numerous accessways that provide bicycling connections. The potential for developing continuous low-traffic bicycle routes in this part of town is limited by disconnected streets and by limited crossing opportunities over Randy Papé Beltline.

Most major roadways in northeast Eugene have bike lanes, such as Norkenzie Road.

Confident bicyclists have many bike lane choices to traverse this part of town, as every minor arterial roadway as well as Coburg Road (a major arterial) has been provided with bike lanes. Some streets (e.g. Norkenzie Road and Gilham Road) have a three-lane cross section and few commercial land uses, which results in a lower-stress bicycling environment. However, Coburg Road's five-lane cross section and high vehicle speeds and volumes are uncomfortable for many bicyclists, particularly for turning or crossing.

Major bicycling destinations within this sector include Autzen Stadium and Oakway Center, Delta Oaks, and Valley River Center shopping centers. In addition, this sector offers two off-road opportunities to cross I-5 into Springfield, one in Alton Baker Park and one at the I-5 Bike Bridge south of Randy Papé Beltline.

This part of Eugene has numerous bicycle access points to the Ruth Bascom Riverbank Path System, including the Green Acres Road path north of the Ossowo Bike Bridge, the Delta Ponds Bridge (currently under construction), several connections from Goodpasture Island Road, the Ferry Street Bridge from Coburg Road, and several access points through Alton Baker Park.

Transit Service and Facilities

Transit Service

Intercity Bus Service

Amtrak, Greyhound Bus Lines, and Porter Stage Lines provide intercity bus service from their stations in Eugene to locations throughout the Northwest.

Eugene Greyhound Station.

Amtrak's intercity bus routes provide transportation service in addition to their regularly scheduled train service (see the *Rail System* section for more information on Amtrak passenger rail service). The Amtrak intercity bus service arrives at and departs from the Eugene Amtrak Station (433 Willamette Street) and provides service north to Albany, Salem, and Portland. Two of the daily trips to Portland connect passengers to train service while the other trips only provide bus service to the Portland train station. Bus service east to Ontario and west to Florence is provided through coordination with Porter Stage Lines and is described separately. Table 5 provides an overview of the Amtrak intercity bus schedule.

TABLE 5
Amtrak Intercity Bus Departures from Eugene

Destination	Length of Trip	Frequency*	Cost**
Portland, OR	2 Hours 30 Min – 2 hours 35 Min	3-4	$23.00
Salem, OR	1 Hour 25 Min	3	$15.00
Albany, OR	0 Hours 50-55 Min	3	$13.00

* # of departing trips per day

** Costs vary depending on weekend/weekday travel.
Source: www.amtrak.com; Amtrak Route Schedule

At the Albany Amtrak station, passengers can connect to a bus bound for Newport, Oregon. This bus is administered by a company independent of Amtrak. Service from Albany to Newport occurs twice per day.

Greyhound Bus Lines provides intercity bus service to destinations around the country. In Eugene, the Greyhound bus station is located at 987 Pearl Street in the downtown commercial business district. Greyhound provides service to a variety of destinations north, south, east, and west of Eugene, including major cities such as Portland, OR; Seattle, WA; Vancouver, BC; Sacramento, CA; and San Francisco, CA. Service is also provided to many of the smaller towns en route to these larger cities and to Newport, OR. Table 6 provides information about the major destinations served, as well as service frequency and cost. Tickets bought online for weekday trips are generally the least expensive and tickets bought in person for weekend trips are generally the most expensive.

TABLE 6
Departures from Eugene's Greyhound Bus Station

Destination	Length of Trip	Frequency*	Cost**
Bend, OR	5 Hours 0 Min	1	$32.56 – 47.50
Corvallis, OR	0 Hours 50 Min	2	$12.32 – 20.50
Medford, OR	3 Hours 35 Min - 3 Hours 55 Min	4	$29.04 – 42.50
Newport, OR	4Hours 20 Min – 9Hours 10 Min	1- 3	$29.04 – 42.50
Roseburg, OR	1 Hour 15 Min	4	$20.24 – 31.00
Salem, OR	1 Hour 20 Min – 1 Hour 45 Min	4	$14.52 – 23.00
Portland, OR	2 Hours 25 Min – 3 Hours 5 Min	4	$19.80 – 30.50
Seattle, WA	6 Hours 30 Min – 7 Hours 25 Min	3 or 4	$41.36 – 54.00
Vancouver, BC	12 Hours 5 Min – 12 Hours 25 Min	3	$84.48-117.00

** Costs vary depending on weekend/weekday travel and whether tickets are purchased online or in person.
Source: www.greyhound.com

Porter Stage Lines provides service from Eugene to destinations east and west of the city. Daily service is provided from Eugene east to Ontario, Oregon (through Bend, OR) and west to Florence and Coos Bay. The cost to travel from Eugene to Bend is $29 on weekdays and $31 on Fridays, Saturdays, and Sundays. The cost for a one-way ticket from Eugene to Florence is $37 on weekdays and $39 on Fridays, Saturdays and Sundays. Tickets can be purchased for Porter Stage Line routes at the Eugene Greyhound Station.

Intracity Bus Service

LTD provides public transportation services within the Eugene-Springfield area and surrounding communities. Twenty-seven regular bus routes and one BRT route serve the City of Eugene. Eugene Station, located at W 10th Avenue and Willamette Street, is the major transit hub in Eugene. Bus routes radiate out from Eugene Station along major corridors to provide service to residents outside of the central city. Figure 13 displays transit routes and facilities within the study area.

Eugene Station

Service on most routes, is provided from 6 a.m. to 11 p.m. on weekdays, 7 a.m. to 11 p.m. on Saturdays, and 8 a.m. to 8 p.m. on Sundays. On weekdays, most regular bus routes run every 30 minutes during peak hours and every 60 minutes during non-peak hours. Route 12

Gateway, from downtown along Coburg Road to Springfield, has more frequent service than the majority of routes with 15 minute headways during peak travel periods. Ten routes only have Monday – Friday service (routes 27, 28, 55, 73, 76, 78, 27, 82, 85, and 92) and three routes have Monday – Saturday service (routes 33, 79X, and 81). Of the 16 routes that offer both Saturday and Sunday service, the majority run every 30 to 60 minutes on weekends, depending on the route and time of day.

Service changes planned to take effect on September 19th, 2010 include additional or reduced trips on select routes and altered routes. Saturday and Sunday service has also been extended on some routes. Route 28 will gain service on Saturday and Sunday and Route 25 will be eliminated.

Table 7 provides an account of fares for system users. Discounted fares are provided for youth, individuals with disabilities, and Medicare cardholders (EZ Access). Children (5 and under) and Honored Riders (65 and older) are granted free access to transit services. Middle and high students are also eligible for free transit passes during the school year. Single fare and day passes can be purchased from the LTD bus driver and at the EmX stations. Monthly bus passes are sold at the LTD Customer Center at Eugene Station, select grocery and convenience stores, and on campus at Lane Community College and the University of Oregon.

TABLE 7
Lane Transit District Fares

Fares	Cash	Day Pass	Monthly Bus Pass	3-Month Bus Pass
Adult 19-64	$1.50	$3.00	$48	$130
Youth 6-18	$0.75	$1.50	$24	$85
EZ Access	$0.75	$1.50	$24	$85
Children (5 and under)	FREE			
Honored Rider (65 and older)	FREE			
Middle and high school students (during the school year)	FREE			

Source: LTD Readers Digest 2010, www.ltd.org

LTD has recently implemented a transit information text messaging service, called Route Shout, on a limited test basis. Route Shout enables riders to access information about the next scheduled bus arrival time at all major bus stops. Bus stops with Route Shout include circular displays that instruct riders where to send the text message to get information on their unique stop.

Bus Rapid Transit Service

A Bus Rapid Transit (BRT) system provides service that in many ways is similar to light rail or streetcar service, including exclusive bus right-of-way, less frequent stops, higher

frequency service, improved stations, signal priority, level boarding, and off-board fare collection. Lane Transit District has a BRT system, called "EmX," that includes many of these features. Figure 14 displays the existing and planned BRT system within the study area.

Route Shout display.

The Green Line, Eugene's first BRT line, was opened in January 2007. This line runs from the LTD downtown station, Eugene Station, primarily along Franklin Boulevard to Springfield. Sixty percent of this route has exclusive right-of-way, which enables efficient service during all traffic conditions. The Green Line is 4 miles in length and runs every 10 minutes during weekday peak travel periods. During off-peak hours and weekends, the service frequency is every 20 minutes. A trip from Eugene Station to Walnut Station along the Eugene-Springfield border, takes approximately 8 minutes one-way.

EmX exclusive right-of-way.

EmX bus at Walnut Station.

LTD currently has six BRT vehicles. These vehicles can accommodate 3 bicycles and 44 seated individuals or 100 standing individuals. In 2008-2009 the EmX had almost 1.6 million boardings. The cost for providing this service was $1.15 per boarding, which is a third of the cost to operate other LTD routes. A second BRT corridor will begin operation in Springfield in January 2011. It will provide a one-seat ride between major destinations in Springfield, the University of Oregon, and the downtown Eugene Business District. LTD and the Federal Transit Administration (FTA) are currently planning a new West Eugene EmX Extension. The Alternatives Analysis Report and Draft Environmental Impact Statement are currently being developed by LTD. A preferred alternative is expected to be selected by local decision makers during Fall 2010.

RideSource Services and the RideSource Call Center

Ride*Source* is the local public transportation alternative for people with disabilities who are unable to independently use LTD bus service due to a disability. Ride*Source* is provided under the requirements of the Americans with Disabilities Act (ADA) and operates throughout Eugene within ¾ miles of regularly scheduled metro bus routes. Lane Transit District administers Ride*Source* and the associated Ride*Source* Call Center. Direct operations are managed through a non-profit agency, Special Mobility Services.

Ride*Source* is a curb-to-curb advanced reservation service. Ancillary services include the RideSource Shopper a once a week grocery shopping service and Ride*Source* Escort door-to-door trips primarily to and from medical appointments using volunteers. Ride*Source* hours

are from 5:30 a.m. to 10: 30 p.m. on weekdays, Saturday from 7 a.m. to 10:30 p.m., and Sunday 8 a.m. to 7:30 p.m. The fare for Ride*Source* is $3.00 one-way and $6.00 per round trip. The RideSource Shopper fare is $2.00 per round trip.

In 2008 LTD created the Ride*Source* Call Center to further improve coordination and simplify access for people who need transportation that requires unique features or fulfills an agency standard. The Ride*Source* Call Center is a "one-stop" center in Lane Transit District's Ride*Source* facility located at 2nd and Garfield in Eugene. A local telephone number (and a toll-free number for rural Lane County) is used by customers to call and arrange for trips. The Ride*Source* Call Center uses an array of public, non-profit, and private transportation providers.

Transportation currently managed through the Ride*Source* Call Center:

- **Non-Emergency Medical Transportation** provided through the Department of Human Services Medicaid program for eligible participants
- **Ride*Source* Complementary Paratransit** for people who are unable to use regular fixed-route service due to a disability as required under the ADA
- **Pearl Buck Pre-School Transportation** for children of disabled parents
- **Senior and Disabled Services Community-based Transportation** for eligible individuals who live in community residential rather than more formal institutional settings
- **Lane County Developmental Disabilities Work Transportation** for individuals with developmental disabilities case managed through Lane County
- **Volunteer Escort** for individuals without transportation options and who require the assistance of an attendant

LTD, through the Ride*Source* Call Center, has succeeded in combining services, allocating shared costs across multiple programs, and having a "one-stop" point of entry for persons who need accessible transportation or who are eligible for human services transportation. The Call Center currently arranges approximately 27,000 one-way trips for 2,800 customers per month.

LTD has a distinctive arrangement with the City of Eugene's Hilyard Community Center. Adaptive Recreation and LTD have an agreement to work cooperatively to provide transportation to and from the Hilyard Center for area residents who are eligible to use RideSource. The Center has full use of an LTD-owned accessible vehicle that is leased to the City. In turn the Center takes program participants one day each week on a schedule provided by RideSource dispatchers. LTD pays the Center a fixed reduced rate per trip.

Carpool/Vanpool

LTD's point2point Solutions provides a variety of carpool matching services to residents in Eugene including pool2school, pool2work, and pool2college. The application form for these matching services is provided on the point2point Solutions website. Employers can sign-up as a partnering agency with point2point Solutions for the Emergency Ride Home Program (ERHP). This program provides individuals who carpool, walk, bike, or take transit to work with an alternative for getting home in an emergency situation. Employees of partnering

agencies are automatically signed up for ERHP when they apply for carpool matching services through the point2point Solutions website.

Valley VanPool provides vanpool services between Eugene and Salem (5 routes) and Eugene and Corvallis (3 routes). The cost for this service depends on the average number of monthly miles and other costs associated with van operations, depreciation, insurance, and maintenance. For a van with 14 passengers, the average monthly cost is $90 to $170 dollars per rider. Participants can register for the service on Valley VanPool's website. The ERHP is provided for vanpool users as well.

Park and Ride Facilities

LTD operates 24 park and ride facilities throughout the Eugene-Springfield area, 13 of which are located within the City of Eugene. Table 8 provides information about the park and rides within the City of Eugene.

Ridership

Transit ridership in Eugene is compared to US cities with similar populations and characteristics in Table 9 below:

TABLE 9
Transit Ridership in Eugene and Similar US Cities

City	2009 Population[1]	Public Transportation Commute Mode Share (2008)[2]	Transit Agency Annual Service Hours (2008)[3,4]	Transit Agency Annual Passenger Miles (2008)[3,4]
Eugene, OR	153,272	7.1%	401,000	43,061,000
Salem, OR	155,469	3.8%	422,000	19,933,000
Spokane, WA	203,268	5.5%	681,000	51,976,000
Boise, ID	205,707	0.8%	123,000	6,231,000

1 Source: US Census Population Finder, US Census Bureau
2 Source: American Community Survey, US Census Bureau
3 Source: National Transit Database;
4 Eugene = Lane Transit District (LTD); Salem = Cherriots; Spokane = Spokane Transit Authority (STA); Boise = Valley Regional Transti (VTA)

Additionally, Lane Transit District conducts ridership surveys throughout their service area every few years. The two most recent surveys were conducted in May of 2004 and October of 2007. The findings discussed in the remainder of this section are the results of both of these surveys. Information specific to transit ridership in Eugene is listed as available in the 2007 survey report.

Demographics

The LTD 2007 Origin/Destination Study released general demographic information for riders of EmX and all routes at the district level. Demographic findings of LTD riders are summarized below:

- 29 percent are 20 years old or younger and 63 percent of riders are 30 years or younger.
- 59 percent have annual household incomes equal to or less than $25,000.
- 34 percent are students only and 21 percent are students and employed.

- 37 percent are transit dependent and 16 percent share a vehicle with another individual in their household.
- EmX riders were found to be generally older than riders on other routes with a lower percentage of riders under 20 years old (20% of EmX riders compared to 31% of riders on other routes) and a higher percentage of riders 20-30 years old (37% compared to 33%) and 31-60 years old (41% compared to 31%).

Ridership trends

The 2007 study also looked at ridership trends within the City of Eugene and the larger transit district between its study and the preceding survey from 2004. Ridership trends in Eugene include:

- Seventy percent of LTD riders begin their trips in Eugene; this is a slight decrease from the 2004 rate of 75 percent.
- Most LTD trips both begin and end in Eugene; this trend has been true since the 1999 ridership survey. In 2007, 60 percent of all trips both began and ended in Eugene and 9 percent of all trips began in Eugene and ended in Springfield.
- In 2007, forty two percent all EmX trips both began and ended in Eugene. This means that 42 percent of all EmX riders used EmX to travel within Eugene and did not travel into Springfield.
- Twenty two percent of riders who took trips beginning in Eugene were new riders; this is an increase from the 2004 rate of 10 percent[10].
- About 31 percent of riders who took trips beginning in Eugene indicated they rode transit more than in the previous year; a decrease from 41 percent in 2004.

The study also included a number of ridership statistics for the entire LTD service area. These characteristics include:

- Twenty nine percent of all passengers took transit to commute to work and 31 percent took transit to commute to school.
- A higher percentage of EmX riders use the service to commute to work than on other transit routes.

Rider Feedback

The 2007 study also asked riders about their satisfaction with LTD service and desired service improvements. A summary of survey findings is listed below:

- The majority of riders are satisfied with LTD service. The overall service quality rating was 5.6 out of 7.
- Twenty three percent of riders indicated that the service was excellent (the highest rating); this represented a slight decrease from 25 percent in 2004.

[10] Overall ridership increased from 2004 to 2007; however, the two surveys may not be directly comparable since the surveys took place at different times of the year.

- EmX riders were generally more satisfied with the frequency of transit service, schedule reliability, and the speed of service.
- The most desired service improvements are increased service frequency on weekends and later evening service.

LTD is currently in the process of creating a long-range transit plan. Once complete, the recommendations in the LTD long-range transit plan will be interwoven with the Eugene Transportation System Plan.

Rail System

Freight Rail

Several railroads own tracks and/or operate in the City of Eugene, including Union Pacific (UP), Burlington Northern Santa Fe (BNSF), and Portland & Western. Additionally, Amtrak leases tracks from UP and operates a passenger rail service, which is discussed in more detail under *Intercity Passenger Rail*. The rail system is depicted in Figure 6, along with freight routes.

The following is a description of the facilities and active freight rail service provided by each railroad in Eugene:

- **Union Pacific (UP):** UP owns the railroad tracks and storage yard that parallel the NW Expressway. The tracks run north to the Portland-Metro area and southeast through Springfield, Oakridge, Klamath Falls, and into California. A few spurs connect to businesses with active rail sidings just north and south of the storage yard. UP operates approximately 20 freight trains per day through Eugene along these tracks. UP also leases operating rights along these tracks to Amtrak, which provides passenger rail service north and south of Eugene. Approximately 3 passenger rail trains operate per day on these tracks. Additionally, UP owns and operates the tracks and several spurs that head west from the storage yard past Randy Papé Beltline to S. Danebo Avenue. UP operates approximately 1 train per day along these tracks to serve the businesses with rail sidings along the spurs. East of S. Danebo Avenue the tracks switch ownership and become inactive out to the coast.
- **Burlington Northern Santa Fe (BNSF**): BNSF owns the railroad tracks and spurs that parallel Hwy 99N. The tracks run north to the Portland-Metro area and end in Eugene at Almaden Street and 5th Avenue in the Whiteaker Neighborhood. Several businesses have active rail sidings along these tracks. BNSF does not operate any trains on the tracks; rather, they lease the operating rights to Portland & Western.
- **Portland & Western (P&W):** P&W operates approximately 2 trains per day on the tracks owned by BNSF.

While not a railroad, the Port of Coos Bay recently purchased a set of inactive railroad tracks that head west from Eugene out to the coast. These tracks were previously owned by the Central Oregon and Pacific Railroad (CORP), but were abandoned in September of 2007 due to deferred maintenance and safety concerns. Currently, the Port of Coos Bay is repairing these tracks using a $2.5 million American Recovery and Reinvestment Act (ARRA) grant and a $13.6 million TIGER 2 grant. Once the rail line is rehabilitated the Port of Coos Bay

reports that it will contract with a shortline railroad to operate rail service between Eugene and Coos Bay[11]. The proposed operating name for the rail line is Coos Bay Rail Link (CBRL).

Additionally, the Central Oregon and Pacific Railroad (CORP) owns and operates a set of railroad tracks just outside the City of Eugene. These tracks head south from the UP main line just east of I-5 to the Medford and Ashland areas. CORP operates approximately 2 freight trains per day on these tracks.

At-Grade Crossings

A total of 35 at-grade railroad crossings currently exist within the study area. At-grade crossings could create a safety conflict between trains and other modes of transportation. The locations of at-grade crossings within the study area are shown in Figure 6.

The At-Grade Railroad Crossing at Irvington Drive and NW Expressway.

The project team visited two at-grade railroad crossings - the crossing at Irving Road and the NW Expressway and the crossing at Irvington Drive and the NW Expressway. Union Pacific and Amtrak operate a total of approximately 25 trains per day along these tracks. Initial findings from the site visit show that the two visited at-grade railroad crossings appear to have a short distance (12 feet) between the crosswalks and the railroad crossing stop lines for westbound auto traffic. In general, problems can arise if vehicle queuing is longer than available storage space or if sight distance is poor. The Lane County TSP currently has a safety project planned at the Irving Road at-grade crossing location.

Railroad Quiet Zone

Federal law requires trains to sound their horns prior to entering at-grade crossings to warn motorists, bicyclists and pedestrians that the train is approaching. In February 2008, the Eugene City Council voted to make it a priority to have a downtown railroad quiet zone established for safety, economic development, and livability reasons. In an approved "railroad quiet

Potential Railroad Quite Zone Area in the Whiteaker Neighborhood.

[11] http://www.portofcoosbay.com/railrehab.htm

zone," the use of train horns would be reduced because other supplemental safety measures would be in place to reduce the risk of collisions. The area being considered for a railroad quite zone in the Whiteaker Neighborhood includes 10 at-grade crossings from Van Buren Street to Eighth Avenue at Hilyard. There has been no funding dedicated to the quiet zone study.

Intercity Passenger Rail

The Amtrak station is located in the Downtown neighborhood at 433 Willamette Street. The station has an enclosed waiting area, and restrooms and payphones are available during station hours. The station is open Monday – Sunday from 4:30 am to 9:00 pm and for limited service from 11:00 pm to 12:45 am. Hourly and short-term parking is provided at the station as well as taxi service.

Eugene Amtrak Station.

Amtrak provides intercity passenger rail service between the City of Eugene and cities north and south of the city. The Amtrak Cascades route travels from Eugene to Vancouver, BC and the Coast Starlight route travels from Seattle to Los Angeles. Each day the train departs northbound from Eugene three times and southbound from Eugene once (see Table 10). During the fiscal year 2009, 104,481 boardings and alightings occurred at the Eugene Amtrak station. This was an increase of 4,270 boardings and alightings from the 2008 fiscal year[12].

TABLE 10
Amtrak Passenger Rail Service

Departure Time	Arrival/Departure	Direction	Route
5:30 AM	Departure	Northbound	Cascades
9:00 AM	Departure	Northbound	Cascades
12:44 PM	Arrival/Departure	Northbound	Coast Starlight
5:10 PM	Arrival/Departure	Southbound	Coast Starlight
8:50 PM	Arrival	Southbound	Cascades
11:45 PM	Arrival	Southbound	Cascades

Sample Amtrak passenger rail ticket prices and trip lengths are described for common destinations in Table 11. Ticket prices and trip lengths vary depending on the route taken (Cascade or Coast Starlight), the date and time of departure, and how long in advance the ticket is purchased.

[12] Source: Amtrack.com

TABLE 11
Passenger Rail – Sample Ticket Prices and Trip Lengths from Eugene Station

Destination	Adult Ticket* (16 or older)	Child Ticket* (ages 2 - 15)	Trip Length	Frequency
Portland	$23 - $33	$12 - $17	2.5 – 3 hours	3
Seattle	$48 - $80	$24 - $40	6.5 – 8 hours	3
Redding, CA	$52	$26	9 hours	1
Los Angeles, CA	$120	$60	28 hours	1
Portland	$23 - $33	$12 - $17	2.5 – 3 hours	3
Seattle	$48 - $80	$24 - $40	6.5 – 8 hours	3

* Ticket price depends on date and time of departure and ticket purchase date
Source: Amtrack.com

The Portland to Eugene rail segment is part of the Pacific Northwest Rail Corridor (PNWRC) between Vancouver, British Columbia and Eugene. The PNWRC has been designated a high speed rail corridor by the Federal Rail Administration (FRA). "High speed" is defined by the FRA as rail service that is "reasonably expected to reach speeds of at least 110 mph." In 2009 the federal government made over $10 billion dollars available for planning and capital investment for states' intercity passenger rail programs. The Oregon High Speed/Intercity Passenger Rail (HSIPR) program aims to improve passenger rail service between Portland and Eugene over the next 20 years through decreasing travel times, increasing service frequency, and improving reliability. To implement this strategy, Oregon has developed the following service objectives for passenger rail between Eugene and Portland:

- Increase average passenger train speeds (from 42 to 65 miles per hour).
- Increase maximum passenger train speeds (from 79 to 110 miles per hour).
- Reduce average passenger rail trip time (from 2 hours and 35 minutes to 1 hour and 55 minutes).
- Increase on-time performance of passenger trains (from 68% to 95% or more).
- Reduce conflicts between heavy rail and highway users.
- Avoid expenditure of $20 billion in highway user costs, including travel time, incidents, vehicle operating costs and highway maintenance.
- Reduce carbon emissions (by 69,138 pounds per year) in support of national and state policies and efforts to reduce GHG emissions and slow climate change.
- Enhance intermodal connections to existing and planned commuter rail, light rail, streetcar, bus service, park and ride, and bike/pedestrian facilities compatible with regional and local plans within the corridor.

Oregon's High Speed/Intercity Passenger Rail (HSIPR) program has applied for funding to prepare an environmental assessment and conduct an alternatives analysis to identify a preferred high speed rail route in Oregon; both of which are required to receive federal funding.

Eugene Airport

The Eugene Airport at Mahlon Sweet Field (EUG) is located near Highway 99 about 10 miles northwest of downtown Eugene. The airport is in the northeast corner of the Eugene Urban Growth Boundary, outside of Eugene's city limits (See Figure 15). The airport has been at this location since 1964.

Industrial, farm, and retail uses primarily exist in the area surrounding the airport. The land uses adjacent to the road that leads to the airport, Airport Road, are primarily industrial businesses including a motorcoach construction company, an industrial park, and equipment manufacturing companies. A large equipment retail store also exists along this road.

Eugene Airport Terminal.

Facilities

EUG's Mahlon Sweet Terminal was completed in 1990. The terminal has two concourses that include rental car service, two restaurants, a gift shop, and an art gallery.

Two automobile parking lots are located at EUG. The main parking lot has 241 short-term and 714 long-term parking spots and is located adjacent to the terminal. The charge for short-term parking is $1.25 per half hour or $14 per day. The long-term parking charge is $2.50 per hour, $9 per day, or $54 per week. The overflow parking lot has 585 spaces and is located southeast of the terminal. An airport shuttle is provided between the terminal and the overflow lot. The employee parking lot has 200 parking spaces.

Walkway connecting terminal to parking lot.

EUG currently has two operational runways. Runway 16R-34L is the primary runway and is designed to accommodate aircrafts as large as a Boeing 767, Boeing 787, and Airbus A300. This runway is 8,009 feet long and 150 feet wide. Runway 16L-34R is the secondary runway at EUG. This runway is 6,000 feet long and 150 feet wide. It is designed to serve the same type of aircrafts as runway 16R-34L, but is used primarily by general aviation aircraft (planes not used for commercial or cargo purposes). Commercial flights can use the secondary runway when the primary runway is offline. The runways are parallel to each other so that they can be used simultaneously. Operation projections for the year 2026 show that only one-third of the capacity will be used in the long-term.

Fourteen taxiways exist at EUG. One taxiway runs adjacent to each runway and the other 12 taxiways provide connections between the taxiways and the terminals, the cargo and the general aviation ramps, and the parallel runways.

EUG has five aircraft parking ramps: the commercial ramp at the terminal, a cargo ramp, and three general aviation ramps. The commercial terminal ramp is 25,000 square yards and the terminal building pier design maximizes the capacity of this space. The three general aviation ramps are used by general aviation and charter aircrafts for storage and service. Two of the ramps contain facilities that can accommodate larger charter planes. The cargo ramp contains an apron that provides for the transfer of cargo from aircraft to truck. The current apron can accommodate seven smaller aircrafts. A project began in 2007 to expand the cargo apron to accommodate seven larger aircrafts.

Fifteen T-hanger buildings, containing 130 T-hanger units, and 37 conventional hangers are located at EUG. These hangers are generally owned by private individuals or entities, not the airport.

EUG has four fixed base operators: Flightcraft Services, Friendly Air Service, Lawrence Air Service, and Heli-Trade. Fixed base operators provide a variety of services to commercial and general aviation aircrafts at EUG such as ground handling, maintenance, flight training, catering, aircraft sales and rentals, parking, and fueling services. The level of service provided by these companies varies from full-service to limited service. Heli-Trade provides helicopter service.

Service and Usage

The Eugene Airport Master Plan (2010) states that the EUG's service area is Lane, Linn, Benton, and Douglas Counties and encapsulates a radius of approximately 60 miles. The service area was based on geography and access to the airport compared to other commercial service airports.

EUG is served by four airlines: Allegiant Air, Delta Connection, Horizon Air and United Express. Delta Connection, Horizon Air, and United Express flights are operated by regional airlines and marketed through the larger national companies. Currently, 18-24 commercial departures and arrivals are scheduled on a typical day. Table 12 lists the top ten domestic destinations. These rankings are based on the number of Origin and Destination passengers.

EUG is classified as a non-hub, commercial service, primary airport in the Federal Aviation Administration (FAA) National Plan of Integrated Airport Systems. It is classified as non-hub because enplanements at EUG account for less than .05 of total national enplanements.

Between 2001 and 2004, service was reduced by one-third at the Eugene Airport in response to national trends of low airline passenger rates following the events of September 11, 2001. Ticket prices also increased at the Eugene Airport during this period, affecting travel rates. Since 2004, service and passenger traffic have increased. According to Airport management records, a total of 92,779 aircraft operations (arrivals and departures) and 360,258 enplanements occurred in 2006. The majority of aircraft operations were associated with general aviation aircrafts. FAA projected that in 2011, 97,284 aircraft operations and 384,483 enplanements will occur at EUG.

TABLE 12
Eugene Airport Top 10 Domestic Destinations

Rank	Destination	# of Passengers
1	San Francisco	79,390
2	Los Angeles	45,220
3	Phoenix	34,960
4	Seattle	32,060
5	Denver	26,900
6	Las Vegas	24,940
7	Salt Lake City	24,940
8	San Diego	23,340
9	Orange County	17,080
10	Chicago	14,030

Source: Eugene Airport Master Plan Update, Data Base Products CY2005

In addition to commercial flights, the Eugene airport is also used by cargo, military and general aviation airplanes. In 2006, 178 general aviation airplanes were based out of the Eugene airport. A variety of community services are also administered through the airport, including: search and rescue, emergency medical, sheriff patrol, and fire fighting.

Air cargo fluctuated at EUG between 1997 and 2006, decreasing from 2003-2006. According to airport management records, 2,096,778 pounds of enplaned cargo was transported through EUG in 2006. The Eugene Airport Master Plan (2010) associates the decrease in air cargo with a decrease in air mail and the replacement of national commercial carriers with smaller regional carriers.

Ground Transportation Options

Travelers have four ground transportation options from the Eugene airport: taxi, limousine, shuttle bus, or rental car. Some Eugene hotels also provide shuttle service from the airport to their hotel. A taxi from EUG to downtown Eugene costs between $22-24. An additional $1 per person charge can be charged dependent on the time of travel. The charge for shuttle service, through OmniShuttle, from the airport to downtown Eugene is $21.50. For parties with more than 1 person, each additional person costs $5 dollars. Six companies provide rental car service from the airport, including: Avis, Hertz, National, Budget, Enterprise, and Alamo. Prices vary based on car model as well as day and season of rental. Lane Transit District does not currently serve the Eugene Airport.

Taxi line at Eugene Airport.

Waterways and Pipeline Facilities

Waterways and pipelines also provide transportation opportunities in Eugene. Figure 16 depicts navigable waterways and known pipelines within the study area.

Waterways

Navigable Waterways

The Willamette River is classified as a navigable waterway from river mile 187 (upstream from Eugene near the confluence of the Coast and Middle Forks) to river mile 0 (the confluence of the Willamette River with the Columbia River). Chapter 2 of TransPlan states that there are no maritime ports or navigational facilities within the Eugene TSP study area.

Water Trails

The Willamette River is a designated water trail that extends from Portland to south of Eugene. The Willamette Riverkeepers produces maps of the water trail that contain information about navigational hazards, access points, on-shore facilities, and hiking opportunities[13]. Figure 16 displays the location of boat ramps along the trail.

Pipelines

Two types of pipelines pass through the study area, a natural gas pipeline and a petroleum pipeline. These pipelines are shown in Figure 16 and are described below:

- A natural gas pipeline system runs through the City of Eugene. The Williams Northwest Pipeline Corporation owns and maintains the pipeline system, monitors system capacity, and supplies NW Natural Gas with product to distribute.
- The Kinder Morgan Energy Partners Pacific Pipeline carries petroleum gas from Portland to Eugene. The pipeline is 8 inches in diameter and made of steel. It enters Lane County north of Junction City and terminates in Eugene at their Prairie Road railroad terminal.

Summary of Deficiencies

The following summarizes the deficiencies identified within the existing transportation network in Eugene.

Traffic Operations and Safety Deficiencies

The existing conditions analysis is intended to define the scope and magnitude of safety and operational deficiencies at various locations throughout the City. The operational and safety review of the 50 study area intersections revealed that the following issues may merit further review.

- The Randy Papé Beltline Ramp Termini (Eastbound and Westbound) at Northwest Expressway are stop controlled and both operating at capacity during the design hour

[13] http://willamette-riverkeeper.org/WTrail/UpperSect/Section_jpgs/pages/pg18Key3_jpg.htm

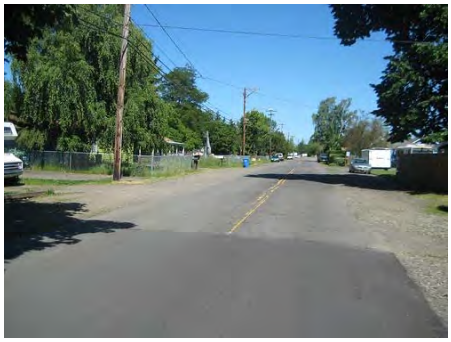
and have experienced a higher than typical rate of crashes during the last five years. A traffic signal is not warranted at either ramp termini today. Intersection treatments to address safety and operational needs should be further considered.

- Increased connectivity and multimodal options over the next several years will likely help to improve accessibility in western Eugene, especially at the Randy Papé Beltline/Roosevelt Boulevard and the Randy Papé Beltline/West 11th Avenue intersections.
- Although no discernable trends or specific safety-related mitigation measures were identified, monitoring of crash experience at the following intersections is recommended: Highway 99W/Roosevelt Boulevard, Bailey Hill Road/West 11th Avenue, Willamette Street/West 29th Avenue, and Jefferson Street/West 7th Avenue.
- At the Chambers Street/West 13th Avenue intersection, the city may want to consider improvements to improve signal visibility, including trimming of trees, higher visibility signal backplates and higher intensity signal lamps. In addition, additional illumination may be considered given the proximity to the school zone. This issue is prevalent at many other locations throughout the city.
- At the Chambers Street/West 18th Avenue intersection, the city may want to consider working with property owners over time to facilitate access management and pedestrian-related improvements.
- At the Coburg Road/Crescent Avenue intersection, an improvement in visibility could include the addition of a second through signal display and replacement of the five-section protected and permissive heads with flashing yellow arrows, increased visibility signal heads, and review of approach signs.
- The City may want to continue monitoring the near capacity condition at the Coburg Road/Country Club Road/Martin Luther King Jr Boulevard intersection. Connectivity options in this area are fairly constrained by the presence of I-105 and the Willamette River.
- Additional connectivity and multimodal options in the future may help to address the at capacity conditions at the Delta Highway Southbound Ramps/Valley River Drive intersection.
- It is recommended that the signing and striping treatments be reviewed at the Washington Street/West 7th Avenue intersection (and west through the upstream Jefferson Street and 7th Avenue signal) to provide a clear and simple message reinforced through the signing and striping treatments. Consideration should also be provided to raised pavement markings, lane extension lines, and higher visibility treatments along the channelized islands and median curbing.
- The 6th and 7th couplet in downtown may need further review in the context of multimodal access and circulation. In particular, operations at the Chambers Street/West 6th Avenue, and Madison Street/West 6th Avenue/I-105 Ramp intersections.

Pedestrian System Deficiencies

Pedestrians face daily obstacles in Eugene, as described below. For a more detailed description of pedestrian needs and deficiencies by geographic area, please see the Eugene Pedestrian and Bicycle Master Plan (PBMP) Existing Conditions Report.

Citywide Pedestrian Deficiencies



Unimproved roadways throughout Eugene lack bicycle or pedestrian facilities.

- **Signals, Intersections, and Sidewalks:** Pedestrians have requested more responsive actuated pedestrian signals with longer walk cycles, wider sidewalks, and filling in sidewalks where they are missing. They have also noted the need for clear sight lines at intersections. Many residents are concerned about right-turning drivers failing to yield the right-of-way to pedestrians crossing the street and left-turning drivers failing to yield the right of way on one-way streets.
- **Shared Use Paths:** Shared-use paths in Eugene are often a victim of their own success, resulting in congested conditions and conflicts between different types of users. Many residents, particularly women, are concerned about lack of lighting on shared-use paths, especially at night. The pavement on some path segments is cracked and heaved as well, which creates tripping hazards. To remedy these deficiencies, users have requested wider paths, soft-surface jogging/pedestrian paths parallel to paved paths, more path lighting, and repaved path surfaces.
- **Lack of Signs:** Eugene's pedestrian system would benefit from signs and other wayfinding tools to orient pedestrians and direct them to and through major destinations, such as the University of Oregon and downtown. In addition, some neighborhoods (particularly around the University of Oregon campus) lack street signs, which makes navigation difficult.
- **Fragmented Sidewalk Network:** Although a relatively complete sidewalk network exists in downtown Eugene and adjacent neighborhoods, the system is fragmented in other areas. Many streets in all neighborhoods outside of downtown, particularly in the River Road/Santa Clara area, lack sidewalks on one or both sides of the road. In addition, the owners of some individual residential lots have never constructed sidewalks, and some have placed structures or plantings that encroach into the public right-of-way.
- **Difficult Crossings:** Pedestrians encounter difficult crossings on higher-volume streets where minimal or no crossing treatments exist. For example, pedestrians encounter relatively high

Pedestrians and bicyclists both report that it is very difficult to cross Willamette Street.

vehicle traffic volumes and few gaps when crossing River Road, Coburg Road, Barger Drive, 30th Avenue, and other major roadways. Additional treatments beyond an existing crosswalk may be necessary to facilitate safe and convenient crossings. Pedestrians with disabilities, children, and the elderly also experience crossing difficulties in Eugene. Curb ramps at many intersections are in poor condition or disrepair, while many intersections in the South Hills, West Eugene, River Road/Santa Clara, and Northeast Eugene areas lack curb ramps altogether. This can make traveling by wheelchair or motorized mobility devices challenging, if not impossible. Visually and mobility impaired pedestrians experience difficulty navigating through intersections with curb ramps oriented diagonally toward the intersection's center rather than toward a crosswalk. Signalized intersections also largely lack audible pedestrian signals to facilitate safe crossings for the visually impaired.

- **Bicyclist Behavior:** Numerous residents have commented that they feel endangered by bicyclists that use the sidewalk and that travel quickly on shared-use paths and pass without an audible signal.
- **Street Lighting:** Some members of the public have complained that a lack of lighting on streets in their neighborhood (e.g. in the Whitaker and South University neighborhoods) makes them uncomfortable walking at night.

Bicycle System Deficiencies

Bicyclists face various issues in Eugene, as described below. For a more detailed description of bicyclist needs and deficiencies by geographic area, please see the Eugene Pedestrian and Bicycle Master Plan (PBMP) Existing Conditions Report.

City-wide Bicycle Deficiencies

- **Shared-Use Paths:** Bicyclists have reported that a lack of signs and markings on shared-use paths can make it difficult to connect to adjacent neighborhoods. They have also mentioned that a lack of lighting on bike paths that serve heavy commuter traffic (e.g. the pathway from Alton Baker Park to Springfield) makes it hard for path users to see during dark or wet conditions. People have also asked for wider pathways with parallel soft-surface running paths to minimize user conflicts and meet the high demand for pathway use.
- **Signed Bikeways:** Many residents have requested specific enhancements for existing signed bike routes, most of which can be summarized as making the route easier for bicycles (safer, more convenient, more direct, easier to find) and more difficult for cars (lower vehicle speeds and volumes). Most signed bike routes in Eugene currently lack additional features that could make them more attractive and comfortable for bicyclists of all ages and abilities, such as wayfinding signs and markings, more robust traffic

Traffic calming on bicycle routes can create a lower-stress bicycling experience.

calming and vehicle diversion treatments, turned stop signs (to favor bicycle through movement), and intersection treatments to facilitate crossing major streets. In addition, many signed bikeways have double yellow center striping along their length or at intersections, which can create the impression that the street is designed for higher vehicle speeds and volumes than their functional classification actually indicates. Enhancing signed bikeways with these features would create bicycle priority streets, often called "bicycle boulevards," that have been shown to attract a wide spectrum of bicyclists.

- **Bike Parking:** Members of the public have noted the need for more and higher-quality covered long-term bike parking at major transit stops (e.g. Amazon Transit Center), for downtown commuters, and at area schools. Bike theft continues to be a major area of community concern, and increasing the quantity and quality of bike parking is one tool to address the bicycle theft problem.
- **Bicycle Intersection Issues:** Numerous residents have complained that traffic signals are not always triggered by the presence of a bicycle. Many intersections have push buttons for bikes on the right side, which does not work for cyclists who position themselves in the center of the lane (particularly when the right-hand lane is a right turn only lane for cars). Efforts to calibrate magnetic loop detectors for bicycles and/or installing video detection can help bicyclists "get the green." Many members of the public have asked for bike boxes, scramble signals, and leading pedestrian intervals to facilitate safer bicycle priority movement at intersections.
- **Bike Lanes:** Policy guidance in Eugene has resulted in five-foot bike lanes where bike lanes are provided (though a few specific locations have narrower bike lanes for historical reasons). Lanes are dashed through some intersections, and a through bike lane has been provided in many instances where a vehicular right-turn lane is provided. These provisions are meeting the needs of confident cyclists but do not provide sufficient protection from cars for children, seniors, and less-confident cyclists. The primary community complaint has been that bike lanes on busy roadways are "scary," "not wide enough," or "need more separation from cars." Many people have asked for wider bike lanes, physical barriers between bike lanes and motor vehicle lanes, reversing the parking lane and the bike lane (so parked cars provide a barrier) and/or colored pavement in bike lanes.
- **Maintenance Issues:** Gravel, glass and other debris are routinely present on the bikeway system, especially on shoulder bikeways (e.g. Green Hill Road). This typically occurs when passing motor vehicles blow debris into the adjacent bicycle lane or shoulder.
- **Poor Pavement Conditions:** Several on-street bikeways are characterized by poor pavement conditions (e.g., University Street), including potholes and uneven surfaces. Unimproved roadways throughout the city generally have rough conditions.

Poor pavement quality, such as on this stretch of University Street, can be a hazard for bicyclists.

- **Lack of Signs and Markings:** Eugene's

bikeway system lacks a comprehensive system of signs, pavement markings, and other wayfinding tools to orient riders and direct them to and through major bicycling destinations like shared-use paths, downtown, parks, and schools. Residents who do not own a bike map have no way of knowing which routes will get them to where they are going, particularly on low-traffic signed bike routes, where no bike lane striping is present to confirm that the road in question has been optimized for bicycling. There is a particular problem with missing street signs in neighborhoods surrounding the University of Oregon campus.

Transit Deficiencies

The following list of transit deficiencies were derived from observations in the field and the transit service ratings included in the 2007 LTD Origin/Destination Study. The desired service improvements listed below do not necessarily represent the majority opinion of transit riders, but rather, highlight areas most desired for improvement.

Bus stops vary in the level of amenities provided.

- The most desired service improvement identified by transit riders in the 2007 LTD Origin/Destination Study was increased service hours, specifically later evening service. Currently, service on most routes is provided from 6 a.m. to 11 p.m. on weekdays, 7 a.m. to 11 p.m. on Saturdays, and 8 a.m. to 8 p.m. on Sundays.
- The second most desired service improvement identified by transit riders was increased comfort waiting for the bus, specifically more bus stops and more bus stop lighting. Bus stops in Eugene currently vary in the type and amount of amenities they offer transit riders, including benches, shelters, lighting, trash cans, and schedules/maps.
- Another desired service improvement identified by transit riders was increased service frequency for both weekdays and weekends. Currently, the majority of LTD bus routes operate on 30 minute headways during peak hours and on 60 minute headways during non-peak hours.
- Some riders also reported desiring an increase in service reliability. Currently, transit riders must rely on published bus schedules to estimate the arrival time of the next bus. While this information is made easily accessible (via the internet, brochures, and by text message at some stops), riders do not know if the next scheduled bus is canceled or delayed.
- Service to new areas was also reported as a desired improvement by some riders. Currently transit service in Eugene is modeled off a hub and spoke system, with the majority of transit routes taking riders to and from downtown Eugene into the surrounding neighborhoods. This can create out-of-travel delays for riders who would like to use transit to access cross-town destinations.

- Transit connections to regional multi-modal facilities, such as the Amtrak Station and Eugene Airport, are additional opportunities for improvement. Transit connections to the Amtrak Rail Station are currently provided by Routes 01 (Cambell Center), 40 (Bethel/Danebo), and 66 (VRC/Coburg). However, bus stops along these routes are located a few blocks away from the Amtrak Station and the routes are not necessarily timed to coincide with the 4 daily Amtrak passenger train departures. Transit service to and from the Eugene airport is not currently provided.
- Some transit riders also reported desiring improved LTD web information. Currently the LTD website links riders to Google Transit for online trip planning services, which does not provide riders with the ability to select preferences for walking distance, number of transfers, or quickest trip.
- In 2007, the majority of LTD transit riders accessed transit on foot (88 percent) or by bicycle (4.4 percent). Ensuring well-lit bicycle and pedestrian connectivity at all major transit stops, adding secure bicycle parking, and ensuring safe bicycle and pedestrian crossings near transit stops are strategies that could help serve these riders.
- EmX bus drivers report that passenger vehicles often mistakenly turn into and drive in the dedicated BRT only lanes. Increasing driver education about dedicated bus-only lanes could help improve driver safety and BRT reliability.
- Currently transit riders in Eugene have the option of buying a single ticket, day-pass, month-pass, or 3-month pass. While, several 3-month passes can be purchased at one time, currently riders do not have the option of purchasing an annual transit pass. Discounted annual transit passes can help decrease the cost and increase the convenience of riding transit.

Confused drivers sometimes drive in EmX dedicated bus only lanes.

Freight System Deficiencies

The 2010 Draft Oregon Freight Plan has identified a number of issues that need to be addressed in order to ensure that Oregon has an efficient and sustainable freight transportation system that supports economic growth and the livability of Oregon communities. The Draft Plan also formulates strategies that ODOT and other local government agencies and jurisdictions, including Eugene, can implement in order to realize the state's freight transportation goals. These strategies are listed below:

- Define a strategic freight system and establish a process for updating the definition of the system;
- Describe how the strategic system should be preserved;
- Periodically revisit existing processes and criteria for determining critical investment needs for the freight system;

- Describe how ODOT can work with partner agencies and other states, local agencies and the private sector to ensure a coordinated approach to freight transportation system planning;
- Establish procedures to ensure the system operates efficiently;
- Identify actions that can be taken to coordinate land use and freight transportation planning decisions;
- Describe how regulatory programs can be coordinated with freight transportation needs; and
- Describe approaches to addressing long-term funding needs for the freight transportation system.

The implementation of these strategies statewide will impact the freight system in Eugene and provides a framework for the City to support and improve freight connections within the study area over the next 20 years.

Rail System Deficiencies

Freight Rail

Strategies identified in the 2010 Oregon Rail Study for Oregon to preserve and expand freight rail access in Oregon include:

- increasing capacity
- developing hub facilities for transloading and aggregating shipments
- providing equipment
- maximizing the development of existing rail-friendly land
- improving deteriorating infrastructure
- growing intra-Oregon rail traffic

These strategies will likely impact the freight rail system in Eugene as the state works to improve and expand the rail system in Oregon over the next 20 years.

Passenger Rail

To accommodate the desired improvements in passenger rail service identified by the HSIPR program, a preferred alignment will need to be identified and several improvements will need to be made to the rail corridor. The 2009 HSIPR Service Development Plan (SDP) identifies several needs, deficiencies, and capital improvements that would affect the rail system within the study area. These needs, deficiencies, and capital improvements are described below:

- Provide rail capacity improvements between Portland to Eugene including track alignment, double track locations, crossing improvements or closures, bridge and track recapitalization allowing for high speed operations, station improvements, signal,

communications and positive train control, and maintenance facilities. (Project #9, HSIPR Service Development Plan)

- Construct two stub tracks at the downtown Eugene passenger station to permit passenger trains to be parked overnight and eliminate the current practice of storing them at Eugene Yard, which requires extra time and expense to travel back and forth. (Project #8, HSIPR Service Development Plan)[14]
- Install a new power-operated crossover between the main track and WP siding north of the passenger depot for enhanced freight access to Eugene Yard. (Project #8, HSIPR Service Development Plan)
- Analyze Eugene Yard to determine if the yard configuration is sufficient for projected 2030 rail traffic levels. A new yard configuration may be necessary to accommodate yard and industrial switching in conjunction with the additional through trains.

At-Grade Crossings

Observations of two at-grade railroad crossings at Irving Road and NW Expressway and Irvington Drive and NW Expressway show that the crossings appear to have a short distance (12 feet) between the crosswalks and the railroad crossing stop lines for westbound auto traffic. At-grade railroad crossings should be reviewed for vehicle queuing distance and storage space once the traffic data is available.

Airport Deficiencies

The Eugene Airport Master Plan Update identified needs associated with a variety of airport facilities. The facilities relevant to the Eugene TSP include airport facilities, terminal facilities, air cargo facilities, general aviation facilities, and automobile parking and circulation.

Airport Facilities

- The runway length of both runways was identified as a potential future deficiency. The extension of 16R-34L runway to 9,200 feet and the extension of 16L-34R to 6,500 feet would allow a greater range of aircrafts to be accommodated on each runway.
- The airport currently has only one baggage claim and does not have a back-up baggage claim.
- Air cargo facilities can only accommodate seven smaller aircrafts. In 2007, a project was started to construct facilities to accommodate seven larger aircrafts.

Surface Transportation and Auto Parking

- Terminal curb front space is projected to be inadequate to meet demand sometime between 2016 and 2026.
- Capacity at the parking lots adjacent to the terminal currently exceed capacity during peak times, resulting in drivers using the remote overflow parking lot. This parking lot

[14] This is part of a larger project at the Eugene passenger station that will include an elevated platform for getting on and off the train.

is more expensive for the airport to administer as it requires a shuttle service and is less convenient for travelers. Public parking (parking adjacent to the terminal and overflow parking) is expected to be inadequate sometime between 2016 and 2026.

- The demand for storage and service spaces for rental car companies currently exceeds capacity at EUG. The number of ready and return spaces currently meets the need for rental car companies but is projected to be insufficient sometime between 2016 and 2026.
- Regularly scheduled transit service is not provided to and from this location. Most originating passengers at EUG use private automobiles to travel to the airport.

Next Steps

The information gathered and presented in this report will be reviewed by a broader audience and the ensuing discussion will serve as the basis for developing the alternatives considered in the Eugene Transportation System Plan. Future goals and policies for the Eugene TSP will be developed with input from project stakeholders and the broader community and will serve as the basis for evaluating the project alternatives.

Appendix B: No Build Analysis

TECHNICAL MEMORANDUM

Eugene Transportation System Plan

Future Conditions Results - No Build Scenario

Date: September 18, 2012 Project #:10296

To: Eugene PMT, TAC and TCRG
Kurt Yeiter, City of Eugene

Cc: Theresa Carr, CH2M Hill

From: Julia Kuhn, Joe Bessman & Matt Kittelson, Kittelson & Associates, Inc.

This technical memorandum presents the key findings related to the year 2035 No Build Analyses for the Eugene Transportation System Plan (TSP). The following analyses relates only to the street system. The quality of service related to active modes of travel (i.e., walking, cycling, and transit) is not directly addressed within this memorandum; rather these modes are directly affected by the conditions projected to occur along the streets and at intersections. Information contained in this memorandum can be used to inform the identification and evaluation of future multimodal transportation system alternatives that meet the goals and objectives guiding the TSP.

All of the technical analyses summarized herein assume that the City will continue to see growth in employment and population between now and the year 2035 in a manner consistent with the existing Comprehensive Plan land use designations, within the existing Urban Growth Boundary (UGB) and consistent with the statewide and regional growth forecasts. At the same time, the analyses assume that the street, transit, pedestrian and bicycle systems will remain as they exist today. This "do nothing" approach from a transportation perspective is commonly used as a foundation by which cities can test the effectiveness of potential projects, policies, and programs. This testing of alternatives helps policy makers to weigh trade-offs regarding future funding priorities in a manner that ensures that the transportation system supports and enhances the continued economic growth, and contributes to the community vision in a manner that is safe, sustainable, fundable and diverse.

As will be discussed in this memorandum, the No Build analyses highlight the following primary deficiencies within Eugene:

- Localized intersection improvement needs,
- Increasing congestion along the West 11th Avenue corridor,

- Increasing congestion along the 6th Avenue and 7th Avenue corridors,
- Heavy demand along Beltline Highway, and
- Heavy demand on the existing river crossings and those facilities connecting Eugene with Springfield and other areas to the east.

The remainder of this memorandum outlines the analyses assumptions and findings.

LAND USE ASSUMPTIONS

Staff from the cities of Eugene and Springfield, Lane County and Lane Council of Governments (LCOG) worked collaboratively to identify where the estimated year 2035 population and employment growth might occur within the region as well as within individual areas of each city. This interagency collaboration ensures that the No Build analyses for Eugene, Springfield, and Coburg start with the same fundamental assumptions and that the population and employment forecasts are "coordinated" for compliance with Oregon transportation and land use planning requirements.

Table 1 shows the existing and future population and employment estimates for lands within the City of Eugene urban growth boundary.[1]

Table 1. Land Use Estimates*

	Year 2010	Year 2035	Growth
Population	177,332	219,060	41,728 (23%)
Households	78,844	97,330	18,486 (23%)
Employees	80,900	114,460	33,560 (42%)

*For the purposes of the No Build analyses, land use growth was concentrated only in the existing urban growth boundary (UGB). Although Eugene is contemplating an UGB expansion, decisions on whether and/or where to expand the UGB have not been made. The impact of growth outside the current UGB would be addressed in subsequent analyses once these decisions have been made.

TRANSPORTATION SYSTEM ASSUMPTIONS

City of Eugene plans, TransPlan and the Regional Transportation Plan (RTP) have previously identified a variety of street, pedestrian, bicycle and transit projects that could be implemented in the future. At this point, there are no guaranteed funding sources for any major projects that will materially affect

[1] The Envision Eugene planning process is evaluating land use designations throughout the city. At this point, no changes to the Comprehensive Plan or zoning designations for individual properties have been adopted as part of the Envision Eugene project. For the purposes of the No Build, the land use designations in place in Spring 2012 were used in determining where growth would occur in 2035. Future modeling efforts will be used to test the transportation effects of the contemplated Envision Eugene assumptions and any land use changes once the Envision Eugene strategies have a greater level of specificity.

traveler behaviors and traffic volumes on the city's street network in the future. For this reason, the No Build assumes that the existing street, pedestrian, bicycle and transit system is in-place in the year 2035 and that will not build any new transportation improvements (other than minor intersection improvements) or implement new programs to lessen automobile traffic on the street system.

TRAFFIC VOLUME DEVELOPMENT

Based on estimates of future job and household growth and the No Build transportation network, LCOG developed traffic volume forecasts for the city's collector and arterial street system, using an emme travel demand model.[2] This model is calibrated to actual traffic volume counts recently measured on streets within the city. In addition to land use and street network inputs, the model also relies on information about existing traveler behavior and trip-making characteristics to understand how people might use the transportation system in the future.

Based on information obtained from LCOG, coupled with measured traffic counts at intersections and roadways within the city, year 2035 intersection and roadway volumes were developed using a procedure consistent with guidance from ODOT's Analysis Procedures Manual (APM).

INTERSECTION ANALYSES

Key street intersections are often the first points in the transportation system to exhibit congestion. Review of these intersections can help inform the identification of localized improvement needs (such as additional turn lanes, new traffic signals, etc.), and can serve as indicators for more significant street network issues.

The No Build intersection analyses focuses on the peak fifteen minutes of the weekday evening commute conditions, when traffic volumes throughout the City as a whole are highest during the day. Although the evening commute period captures many of the system issues, different patterns and needs may occur in the morning, mid-afternoon, or during weekends at specific locations based on adjacent land use characteristics (e.g., school hours, employment shift changes outside of the typical dayshift). Localized improvement needs that occur outside the evening commute period can be evaluated in future corridor, subarea, and other plans prepared outside of the TSP efforts. These more detailed studies can be incorporated into future TSP amendments and capital planning efforts as part of periodic updates.

The Existing Conditions memorandum prepared for the TSP included analyses of 50 intersections throughout the city. The No Build analyses assesses the performance of these same intersections and

[2] LCOG will provide a memorandum detailing the assumptions included in the LCOG Travel Demand Forecasting Modeling under separate cover.

compares the expected intersection performance to adopted city and state standards. These analyses were conducted in a manner consistent with the methodologies outlined in the Highway Capacity Manual and guidance provided in the Analysis Procedures Manual (APM) prepared by ODOT. The City may consider amendments to the adopted performance standards in the later phases of the TSP. For the purposes of the No Build analyses the existing standards were assumed to be in-place.

As discussed in the Existing Conditions Memorandum, the Beltline Facility Plan planning efforts are currently underway. The planning for this Facility Plan has included significant operational, safety and geometric review of the interchanges and adjacent intersections. As part of the TSP No Build review, the Beltline Facility Plan study area intersections were not reviewed. Rather, it is assumed that the findings of the Facility Plan will be incorporated into future TSP efforts.

The year 2035 No Build intersection operations are shown in Table A in the Appendix and are exhibited in Figure 2. For comparison, the Appendix also presents a graphic illustrating the existing conditions findings, as shown in Figure 1. Within Figures 1 and 2, locations where the performance meets city and state standards are colored as green; locations where the city and state standards are not met are shown as red. Specific findings of the intersection analyses are discussed below.

CORRIDOR ANALYSES

For the purposes of identifying future transportation system alternatives, it is also helpful to look at a holistic, corridor approach to understand the No Build deficiencies. This broader system approach can be guided by the comparison of anticipated demand on key corridors within the city to planning-level estimates of street capacity. Review of the street segments can identify network connectivity, functional issues, potential corridor management strategies, and multimodal opportunities. This can ensure that the future transportation system looks, feels and operates in a manner consistent with the community's vision.

To inform this assessment, the comparison of the year 2035 traffic demand to capacity for individual arterial and collector streets within the city was assessed and then classified within three categories:

- Streets that operate "well" – defined for the purposes of this memo as the No Build demand is less than 80 percent of the capacity. These streets are shown in green in the figures.
- Streets that are "nearing capacity" under the No Build – the demand is between 80 and 100 percent of the capacity. These streets are shown in yellow in the figures.
- Streets that are "over capacity" – the No Build demand exceeds the capacity, which is shown in red on the figures.

The results of these analyses are shown in Figure 2. In reviewing Figures 1 and 2, it is helpful to note that the corridor analyses consider a full hour of traffic demand during the weekday commute period whereas the intersection analyses focus on the peak 15 minute time period.

Together, with the intersection analyses results, the corridor analyses can be used to identify the No Build street system deficiencies throughout Eugene. These deficiencies are described in more detail below.

NO BUILD FINDINGS

W 11th Avenue Corridor

The W 11th Avenue corridor provides a connection from downtown Eugene and the University of Oregon to the employment, commercial, and residential areas to the west as well as to outlying communities and eventually to the Oregon coast. Today, this corridor experiences congestion due to the local accessibility and regional and statewide mobility functions it serves.

Under the 2035 No Build analyses, undeveloped residential lands to the south of the West 11th Avenue corridor, particularly near Crow Road are expected to experience considerable growth. The growth in land uses served by the corridor as well as the increasing demand for regional and statewide traffic will place additional pressures on the corridor. As shown in Figure 2, the W 11th Avenue corridor is shown to operate near or over capacity from the UGB into the downtown. In addition, all of the study intersections, except one, along this corridor are also shown to be over capacity. The inability of the W 11th Avenue corridor to serve all of the No Build traffic demand would result in traffic diverting to other corridors, like W 18th Avenue.

In July 2012, the Lane Transit District (LTD) released the West Eugene EmX Extension Project Environmental Assessment (EA) to construct bus rapid transit (EmX) in this corridor in the future. The traffic analyses prepared to support the EA assumes that the projects identified in the RTP are in-place under the EA's No Build Alternative. Per this EA, even with the RTP projects and the implementation of EmX, this corridor and many of the intersections along it are projected to experience significant congestion in the year 2035.

The TSP and EA analyses suggest that a series of system, corridor management and demand management strategies could help to address future multimodal needs along West 11th Avenue. Examples of these types of strategies are outlined at the end of this document.

West 18th Avenue Corridor

Today, this corridor serves as a key facility in connecting pedestrian, bicycle and vehicular trips from local streets to both the regional arterial network and into downtown and the University of Oregon. Although this corridor isn't congested from a vehicular standpoint today, its current configuration can feel constrained to pedestrians and bicyclists, especially.

Under the 2035 No Build analyses, undeveloped residential lands to the south of the West 18th Avenue corridor are expected to experience considerable growth. This growth, combined with the potential

diversion of traffic to this corridor resulting from considerable congestion on West 11th Avenue, could result in the demands for West 18th Avenue reaching or exceeding the available vehicular capacity. This same demand-to-capacity forecast is also shown on Bailey Hill Road and on Bertelsen Road under the No Build scenario.

Although the intersection analyses did not reveal specific intersection constraints, the findings suggest that the demands for the West 11th and West 18th Avenue corridors in serving both local and regional multimodal travel need to be taken into context together when considering possible solutions.

Highway 99

Highway 99 serves as one of the regional arterials within Eugene, connecting employment and residential lands to the downtown. Highway 99, like other regional roadways (e.g., the Beltline Highway, West 11th Avenue, I-105), also serves as a key corridor for freight movement within the city. In addition, Highway 99 provides a connection between Eugene and Junction City to the north. Within the vicinity of the Beltline ramps, Highway 99 begins to transition from a rural highway to a more urbanized corridor. As such, most of the congestion expected along Highway 99 in the future occurs south of Beltline Highway and increases as the highway approaches the downtown area.

Today and in the future, congestion occurs at the intersection of the Beltline ramps with Highway 99; this congestion can also be problematic on weekends, given the proximity of commercial uses to the interchange. Significant growth expected in Junction City (both residential and employment, such as the hospital and state correctional facilities) will also increase the regional demand along this corridor Further, intersections along the corridor to the south of Roosevelt Boulevard and transitioning into the 6th Avenue/7th Avenue couplet will be at or over capacity. Future improvements to this roadway should consider how to maintain the regional mobility purpose of this facility through access management strategies and/or localized improvements. Corridor-wide capacity improvements south of Roosevelt Boulevard will be difficult and likely expensive given the existing railroad overcrossing. In reviewing these findings, it is important to note that the No Build analyses do not include the proposed EmX improvements or enhanced transit service in this corridor.

Northwest Expressway

Northwest Expressway serves as the transition between residential neighborhoods to the east and employment uses and the railroad tracks to the west. This corridor is an access controlled roadway connecting northwest Eugene south to River Road, providing an important albeit somewhat underutilized freight connection. Under the No Build, the Northwest Expressway is expected to operate below capacity over much of its length. The section between Irving Road and the Beltline ramp intersections is anticipated to operate over capacity as are the two ramp intersections. The intersection with River Road is also shown to experience over capacity conditions.

River Road Corridor

River Road is a north-south arterial roadway that connects North Eugene travelers with destinations to the south, including downtown Eugene and the University of Oregon. Some users may use Northwest Expressway, or even Highway 99, as alternatives to River Road. However, these alternatives are often out-of-direction for the traveler and River Road provides local access for a number of residences, commercial districts, and schools, including North Eugene High School. Given the length and distinct areas along the River Road corridor, the facility is discussed by segment in the subsections below.

Eugene City Limits to Beltline Highway

Along this northern stretch of River Road, the roadway feels and operates more like a two-lane rural highway than a city street. South of the Eugene city limits, River Road quickly transitions to a suburban arterial, connecting the neighborhoods and schools in Santa Clara with the regional transportation system. Just north of Beltline Highway there are several commercial uses that attract both local and more regional demand.

In the 2035 No Build conditions, growth in the Santa Clara area will increase the regional demand along this corridor. Given that most users are traveling to and from the south, towards the Eugene city core and Beltline Highway, traffic volumes increase along this segment toward the south. In fact, the roadway is expected to exceed capacity between Irving Road and Beltline Highway.

As mentioned previously, the section of River Road near Beltline Highway is part of an ongoing Facility Plan. As such, specific projects and planning strategies will be developed for this area, including this portion of River Road and the River Road/Beltline Highway ramp intersections. The Beltline Facility Plan will be completed separate from but coordinated with the TSP recommendations.

Beltline Highway to Northwest Expressway

This section of River Road generally includes two travel lanes in each direction plus a center turn lane and serves mostly residential neighborhoods with a small mix of commercial uses. In general, the roadway is expected to operate under capacity, though the River Road/Northwest Expressway intersection is expected to exceed capacity.

South of Northwest Expressway

Just south of Northwest Expressway, River Road crosses the railroad tracks at a grade-separated crossing. This crossing represents a critical link in the ability of Eugene's transportation system to provide reliable north-south access for emergency vehicle, regional travel and multimodal travel. There are no alternate grade-separated rail crossings to the west for over 2.5 miles. Further, this connection is especially important because of its proximity to the Emergency Services Training Center, Fire Department logistics building, and Central Lane Communication 911 Center on Second Avenue and the City Public Works yard on Roosevelt Boulevard.

Given the attractiveness of this route, this section of River Road is expected to operate over capacity under future conditions.

6th Avenue/ 7th Street Avenue

6th Avenue and 7th Avenue form a one-way couplet that provides access between Highway 99 and the downtown area. In the east, 6th Avenue and 7th Avenue provide a connection to the Ferry Street Bridge and Coburg Road. This corridor is a major east-west route serving the downtown area and is a major commercial corridor within Eugene. This corridor is also an important freight corridor, playing a role in the economic vitality of the community.

Under the 2035 No Build conditions, 6th Avenue and 7th Avenue are both expected to operate near or over capacity throughout the entire corridor. In addition, most of the intersections studied along these corridors would be over capacity under the No Build.

The existing grid system in the vicinity of the 6th Avenue and 7th Avenue corridors provide travelers with a number of travel options. In addition, EmX is proposed along the corridor, although not included in the No Build analyses as it is not currently funded for construction. The well-developed grid systems creates opportunities for bicycles and pedestrians to travel along less congested roadways, providing a safer and more attractive route than the major roadway system.

Franklin Boulevard

Franklin Boulevard connects downtown Eugene, the University of Oregon campus, I-5 and Springfield. In the future, this corridor will play an important role in serving the redevelopment of both the EWEB (Eugene Water and Electric Board) properties and the Walnut Station mixed use nodal area.

Under the 2035, much of Franklin Boulevard is shown to operate near or over capacity between the downtown and I-5. The proximity of the University facilities to the corridor, especially athletic facilities, also result in peak traffic demand that occur outside the weekday evening commute hour. These larger events typically have event demand management strategies in place designed to maintain a functioning transportation system during such times.

The Franklin Boulevard corridor has an existing EmX line in place. As the system is extended in the future, travelers will be able use the system to travel to this area from farther distances.

Beltline Highway

Beltline Highway serves as a major connection for the West Eugene area to and from I-5 and the northern parts of Springfield. It also provides one of the major river crossings for all of Eugene, particularly for residents in the north. The land use and transportation context varies through the corridor. For the purposes of highlighting the No Build finding, the corridor is discussed in subsections below.

As discussed previously, the section of the Beltline Highway between Coburg Road and River Road is part of the ongoing Facility Plan being conducted by ODOT, the City of Eugene and the County. The findings of this Plan will be incorporated into later TSP efforts. For the purposes of the No Build, general observations from the corridor demand to capacity analyses are summarized below. The details of specific analyses can be found in the Beltline Facility Plan.

I-5 to Delta Highway

East of I-5, the roadway operates as an at-grade highway within Springfield, meaning intersections, not interchanges, provide access to adjacent roadways. At I-5, Beltline Highway transitions to a high capacity, grade separated facility. Like today's conditions, the Beltline Highway is expected to be congested between Coburg Road and the Delta Highway.

The only interchange within this section is with the important north-south connection of Coburg Road. The No Build analyses show that the Beltline ramp intersections will operate over capacity in the future. This would also contribute to congestion along Coburg Road near the interchange.

Delta Highway to River Road

This section of the highway is included in the Beltline Facility Planning efforts. As discussed in the Facility Plan and as shown in Figure 2 of this memorandum, over capacity conditions are expected along this section of the highway, especially on the Willamette River Bridge. This bridge is the only crossing of the Willamette River within all of north Eugene for both regional and local users. In addition, there are a lot of vehicles entering and exiting the Beltline in this segment of the highway. This creates significant "weaving" movements along the corridor as drivers change lanes to either exit or enter the Beltline Highway in this segment. These weaving movements contribute to both congestion and safety-related issues in this corridor. These issues will be exacerbated in the No Build condition.

In addition to the highway itself, the three interchanges (Delta Highway, Division Avenue/River Avenue, and River Road) are also shown to operate near or over capacity in the future. The type of interchange in place today at the Delta Highway allows for higher-speed, free flow traffic movements between the two roadways. Although this type of interchange has more capacity than the type found at River Road ("a diamond" interchange), the need to serve commercial and residential lands to the north of Beltline and to provide one of only two river crossings into the downtown provides additional pressures on the Delta Highway, resulting in near and over capacity conditions.

The Beltline Highway ramps intersect River Road at traffic signals. There are a number of private driveways serving commercial uses as well as a Lane Transit District park and ride within one-quarter mile of the interchange. Serving the traffic demand associated with adjacent land uses as well as regional traffic demand contribute to over capacity conditions at the ramp intersections under the No Build.

River Road to Barger Drive

Within this section, interchanges also provide access to the adjacent roadways. Unlike the section between River Road and I-5, this section of the Beltline Highway is expected to operate under capacity in the No Build. Despite this finding, the ramp intersections at the Northwest Expressway and at Highway 99 are shown to operate over capacity.

South of Barger Drive

South of the Barger Drive interchange, Beltline Highway transitions to an arterial street with intersections, not interchanges, provided for intersecting streets. Between Barger Drive and W 11th Avenue, access to the Beltline Highway is only provided at key intersections, not at private driveways. To the north of Roosevelt Boulevard, the Beltline has two travel lanes in each direction; to the south, it narrows down to one lane in each direction. Between Barger Drive and Roosevelt Boulevard, the Beltline Highway is expected to be under capacity; along the section to the south that is only one lane in each direction, it is expected to operate near capacity in the No Build. In addition, the intersections at Roosevelt Boulevard and W 11th Avenue are expected to operate over capacity.

Coburg Road

Coburg Road provides a regional connection between Eugene in the south and the cities of Coburg and Harrisburg in the north. Within Eugene city limits, Coburg Road is a key regional and local street that provides access to Beltline Highway, I-105, and downtown Eugene. The look and feel and role it serves in the transportation system varies along its length; these key differences are described below.

Eugene City Limits to Beltline Highway

Between the Eugene City Limits and Beltline Highway, Coburg Road provides access to several neighborhoods and commercial uses. Like River Road to the east, the traffic volumes along Coburg Road increase the further south you go. Within this section of the street, both the Coburg Road/Crescent Avenue intersection and the Beltline Highway ramp intersections are shown to operate over capacity in the No Build. The deficiencies at the ramp intersections were also highlighted in the Existing Conditions memorandum and the Beltline Facility Plan.

Beltline Highway to Harlow Road

South of the Beltline Highway, Coburg Road provides access to a number of neighborhoods as well as a large commercial area in the vicinity of Willakenzie Road and Cal Young Road. Within this section, Coburg Road is a 5-lane street that is serves both the local and regional travel needs. Under the No Build, this section of Coburg Road is shown to operate under capacity.

Harlow Road to Willamette River

This section of Coburg Road connects travelers from Springfield (via Harlow Road) into downtown Eugene. Grade-separated access is provided under I-105 and over the Willamette River at the Ferry Street Bridge. This section of the road is shown as overcapacity in the No Build. The Ferry Street Bridge is one of only two bridges within the city that connects into the downtown.

In addition to serving regional travel, this section of Coburg Road also provides access to large retail developments and some of the University of Oregon athletics facilities, including Autzen football stadium and PK Park baseball field. As such, the roadway experiences high levels of demand when events at these facilities take place, though traffic demand management strategies, such as offsite shuttles, are typically implemented to offset some of the roadway congestion. The attractiveness of the large retail users in this corridor also creates congestion on the weekends.

Amazon Parkway/30th Avenue Corridor

The Amazon Parkway corridor provides access between downtown Eugene, neighborhoods to the south and eventually to I-5 and Lane Community College (LCC). Given the topography of this area, travelers using Amazon Parkway have few alternative travel options. As such, this corridor is shown as near or over capacity in the future. The Amazon Parkway/Hilyard Street/30th Avenue intersection is also shown as over capacity.

River Crossings

The Willamette River flows through the Eugene area, providing the city with a beautiful scenic resource. The river corridor is also the city's mainline bike facility. The limited number of vehicular river crossings both today and in the No Build, results in difficult connection and mobility issues. All four river crossing locations within the city (Beltline Highway, Ferry Street Bridge, I-105, and I-5) are expected to approach or exceed capacity in the future (as shown by the red on Figure 2 for all locations except I-5, which is shown as yellow).

In addition to the river crossings within Eugene, the Main Street/S A Street bridges in Springfield are also shown to be over capacity in the No Build. This means that all available river crossing options within the larger urbanized area exceed capacity by 2035. This finding has implications for potential evacuation route planning for emergency services.

DEMAND MANAGEMENT AND SYSTEM MANGEMENT STRATEGIES

Given the size of Eugene's urban area and growing complexity of the transportation system, a set of strategies that focus less on capital improvements and more on the efficient management of the existing infrastructure and vehicular demand could be an integral part of the future functioning of the system. There are a number of transportation system management and operations (TSMO) strategies that can be used by Eugene in the future to lessen the demand for future automobile improvements

and to make better use of the existing infrastructure. Examples of the types of strategies that could be used are discussed below. Further detail regarding these strategies and their application to specific areas within the city will be provided as part of future TSP memoranda.

- Along many of the congested corridors, Eugene has a number of parallel streets and developed grid system that can provide alternative routes for multimodal travel and localized trip making. Finding ways to eliminate gaps in the grid system and to prioritize pedestrian and bicycle treatments along the parallel facilities can help to relieve congested corridors and provide safe and efficient travel for all modes.
- Roadway and intersection safety improvements should be coordinated via a "data driven evaluation system". This allows the city to focus on specific improvements that benefit multimodal travel along corridors and at specific intersections.
- Accessible freight corridors are critical to support a well-functioning local economy. As such, current and future freight corridors should maintain proper design standards to accommodate larger freight vehicles. In addition, specific improvements, such as truck signage, can be used on specific corridors, like the Northwest Expressway, to facilitate the efficient movement of goods. Prioritization of "freight-friendly" improvements can incentivize freight to use specific corridors and re-direct regional freight within specific subareas of the city. At the same time, prioritization of treatments that are aimed at pedestrians, cyclists and transit could occur in other adjacent corridors.
- Intersection capacity needs can be met through the implementation of transit priority signal timing, freight signal priority, transportation system management applications, adaptive signal control, and roundabouts to enhance roadway character and improve access control.
- Continued expansion of the EmX system will help to provide accessible travel options and to reduce traffic demands over time.
- The city's roadway design standards and intersection level of service standards should be flexible to recognize the constrained urban and natural environment and allocate the available right-of-way to pedestrian, auto, bicycle, or transit mobility, or streetscape and parking needs, based on specific facility goals.
- The City is currently participating in the Regional Transportation Options Project (RTOP). This project will provide the region with a series of strategies and programs that reduce the need for single occupancy vehicle travel in the future. Implementation of these programs will be an integral part of ensuring that the City's transportation system continues to support economic growth in a manner consistent with the overall vision for the community.

NEXT STEPS

The review of system needs under the No Build scenario will be compared with the findings of other multimodal systems (transit, pedestrian/bicycle) to complement the list of alternatives considered. The No Build and existing safety and operations analyses will help to inform and prioritize the development of alternatives within subsequent memoranda.

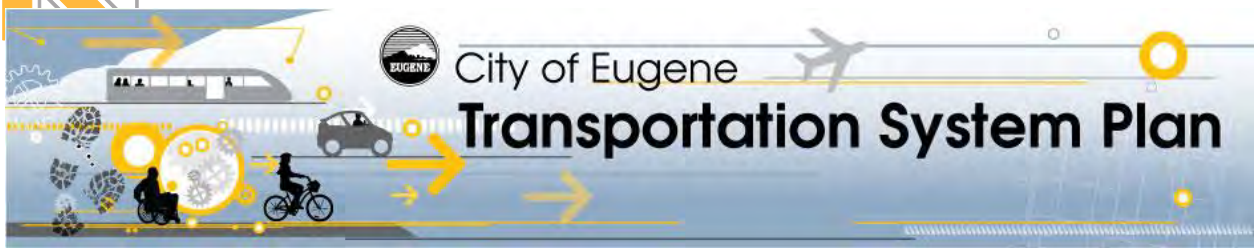
KITTELSON & ASSOCIATES, INC.
TRANSPORTATION ENGINEERING / PLANNING



DRAFT TECHNICAL MEMORANDUM

Eugene Transportation System Plan

Future Conditions Results - Build Scenario

Date: January 22, 2015 Project #:10296

To: Eugene PMT
Kurt Yeiter, City of Eugene

Cc: Kristin Hull, CH2M Hill

From: Julia Kuhn, Matt Kittelson & Ashleigh Griffin, Kittelson & Associates, Inc.

This technical memorandum presents the year 2035 "build analyses" for the Eugene Transportation System Plan (TSP). The enclosed analyses relate primarily to the quality of service experienced by vehicular traffic. The future needs of "active modes" are addressed in separate documents. The build analyses incorporate the assumptions outlined below.

- The City and Region will continue to see growth in employment and population over the next twenty years consistent with Envision Eugene (and the soon-to-be adopted Comprehensive Plan), and the Springfield and Coburg Comprehensive Plans. Additionally, growth in statewide traffic will continue to occur consistent with the Oregon Transportation Plan.
- The City will expand its Urban Growth Boundary (UGB) to accommodate additional growth in population and employment over the next twenty years. This UGB expansion will be incorporated into the soon-to-be adopted Comprehensive Plan.
- Regional growth in population and employment will be supported by the transportation system programs, policies and projects reflected in Springfield's TSP as well as the following categories of transportation system projects in Eugene:
    - *Projects to be completed within 20 years* – frequent transit service improvements including corridor improvements on six key arterials in the city, urbanization of key existing collector and arterial streets to provide for multimodal travel, construction of a local bridge to the north of the Randy Pape Beltline near River Road, roadway capacity improvements at a small number of locations, passenger rail

improvements at the Eugene Station, and two new roadways in the Clear Lake UGB expansion area.

- *20-year Pedestrian and Bicycle System Improvements* – this category incorporates continued implementation of the City's Pedestrian and Bicycle Master Plan. The primary elements of the Master Plan will become part of Eugene's TSP.
- *Projects to Complete Upon Development* – those that are likely needed as new neighborhoods and employment areas develop or redevelop. The timing of these projects is uncertain and they are unlikely to be advanced by the city in the absence of specific private development activities. Typically, these projects address only localized multimodal transportation needs associated with newly developing or redevelopment areas.
- *Operational Projects* – those that are needed at specific intersections and/or corridors to improve the quality of service provided to all modes. This may include the use of technology, implementation of Transportation System and Management Options (TSMO) strategies, signal corridor timing strategies, etc.

The TSP identifies a series of projects for future study to determine when and if a specific multimodal system improvement is needed to address a future deficiency. These projects are not included in the 2035 travel demand model.

TRAFFIC VOLUME DEVELOPMENT AND OPERATIONS ANALYSES

Based on estimates of future job and household growth, LCOG developed traffic volume forecasts for the city's collector and arterial street system, using an emme travel demand model. Based on information obtained from LCOG, coupled with measured traffic counts at intersections and roadways within the city, Kittelson & Associates, Inc. (KAI) developed year 2035 intersection and roadway volumes using a procedure consistent with guidance from ODOT's Analysis and Procedures Manual (APM).

The existing conditions and No Build memorandums prepared for the TSP included analyses of 50 intersections throughout the city. The build analysis includes evaluation of these same intersections plus 12 additional intersections previously analyzed as part of the Beltline Facility Plan. The build analysis compares the expected intersection performance to adopted city and state standards. KAI conducted this analysis in a manner consistent with the methodologies outlined in the Highway Capacity Manual and guidance provided in ODOT's APM.

The year 2035 intersection operations are shown in Table A in the Appendix and illustrated in Figures 1 (No Build) and 2 (TSP Projects). Within the figures, those locations whose performance meets city and state standards are colored as green; locations where the city and state standards are not met are shown as red. Specific findings regarding the analysis are discussed below.

Figures 1 and 2 also include a comparison of the year 2035 traffic demand to capacity for individual arterial and collector streets within the city based on the three categories:

- Streets that operate "well" – the vehicular demand is less than 80 percent of the capacity. These streets are shown in green in the figures.
- Streets that are "nearing capacity" – the vehicular demand is between 80 and 100 percent of the capacity. These streets are shown in yellow in the figures.
- Streets that are "over capacity" – the vehicular demand exceeds the capacity, which is shown in red on the figures.

In reviewing the figures, it is helpful to note that the corridor analyses consider a full hour of traffic demand (based on direct model output) during the weekday commute period. In looking at a full hour of traffic demand, the corridor analyses may not reflect some of the queuing that occurs at intersections. Conversely, the intersection analyses are based on traffic volumes that have been further refined ("post processed" from the model outputs) and reflect conditions that occur during the peak 15 minute time period. Queuing on the roadway segments leading up to intersections would be expected at those locations where intersection operations are shown to exceed standards.

SUMMARY OF NO BUILD FINDINGS

As a basis of comparison, the No Build memorandum highlighted the following key findings:

- *West 11th Avenue Corridor* – both under existing and No Build conditions, the corridor experiences congestion through much of its length and at many of its key intersections. This corridor plays an important role in both regional and statewide mobility as well as local accessibility to the downtown, University of Oregon, residential and employment areas.
- *West 18th Avenue* – under the No Build, this corridor becomes congested primarily between Bailey Hill Road and Pearl Street. This is likely attributable to the planned residential growth in this area of the city as well as diversion of traffic from the congested West 11th Avenue corridor.
- *Highway 99* – under existing and No Build, this corridor experiences congestion as it transitions into downtown Eugene. In addition, congestion occurs under both conditions at the Beltline ramp termini intersections, likely attributable in part to the commercial uses in proximity of the interchange.
- *Northwest Expressway* – for the most part, this corridor operates well under both existing and No Build conditions, with two exceptions; the areas adjacent to and at the Beltline ramp termini as well as to River Road are expected to experience congestion in the future.
- *River Road* – Under the No Build, this corridor is expected to experience congestion between Irving Road and River Avenue as well as at and south of the intersection with the Northwest Expressway. The section between Irving Road and River Avenue will be

influenced by the improvements that result from the ongoing Beltline Facility Plan. The section south of Northwest Expressway includes a critical grade-separated crossing of the railroad that represents the only crossing for over 2.5 miles to the west, thereby serving an important role in emergency vehicle and freight and regional mobility needs.

- *6th and 7th Avenues* – this one-way street pair is expected to operate at or over capacity under No Build conditions throughout much of its length. The couplet provides an essential connection into downtown as well as for regional and local freight mobility.
- *Franklin Boulevard* – this corridor is expected to experience congestion between the downtown and I-5 under the No Build. In addition, given its role in serving accessibility to the University of Oregon (UO), will continue to experience congestion during peak event times on-campus, of which the UO employs a variety of demand-management strategies to mitigate.
- *Beltline Highway* – the corridor serves as a major connection to West Eugene as well as regional and statewide mobility and freight needs. As such, it is expected to continue to experience congestion between I-5 and Northwest Expressway. In the No Build, the section between Roosevelt Boulevard and West 11th Avenue is also expected to experience congestion. The Beltline Facility Plan outlines a variety of strategies that may be implemented over time to address the capacity and safety needs between River Road and the Delta Highway.
- *Coburg Road* – this regional corridor is expected to experience congestion in the vicinity of the Beltline Highway as well as between Harlow Road and the downtown.
- *Amazon Parkway/30th Avenue* – this corridor serves as an important connection between the downtown and residents to the south as well as to I-5 and Lane Community College (LCC) and is expected to see increasing levels of congestion.
- *River Crossings* – under the No Build, all of the vehicular crossings of the Willamette River are expected to be over capacity in Eugene and Springfield. This condition can affect emergency response routes, freight mobility and economic development and regional and local mobility and accessibility.

ANALYSIS OF THE 20 YEAR PROJECT LIST

Through input from the TCRG, regional and local stakeholders and public engagement events, the TSP includes implementation of high frequency transit on six key corridors, pedestrian and bicycle improvements, and roadway/intersections at select locations. Between now and 2035, the TSP assumes implementation of the following categories of improvements:

- Projects to be completed within 20 years;
- Pedestrian and Bicycle System improvements;

- Projects to complete upon development; and,
- Operational improvements to increase the efficiency of the existing roadway system

Many of the projects included in these lists serve primarily localized accessibility and connectivity needs. Examples of projects that provide more regional multimodal capacity as compared to the No Build include:

- Frequent transit service improvements along the following corridors:
  - West 11th Avenue, 6th Avenue and 7th Avenue EmX
  - River Road
  - Coburg Road
  - Highway 99
  - Martin Luther King Jr. Boulevard
  - 30th Avenue/Amazon Parkway
- Construction of a "local arterial" bridge and operational improvements to the Randy Pape Beltline Highway/Delta Highway ramps
- Widening of the Randy Pape Beltline Highway between Roosevelt Boulevard and West 11th Avenue and associated intersection improvements.

With all of the 20 year TSP projects in-place, the corridors highlighted under the No Build analyses are still anticipated to experience similar of slightly lower levels of congestion, as discussed below and reflected in Figure 2.

- *West 11th Avenue Corridor* – Even with the implementation of EmX, this corridor is expected to experience congestion through much of its length and at many of its key intersections.
- *West 18th Avenue* – with the TSP projects in-place, the corridor is expected to experience similar levels of congestion as seen under the No Build although it operates primarily under or near capacity.
- *Highway 99* – this corridor shows slight improvements in congestion levels as compared to the No Build. Intersection improvements, such as installation of roundabouts at the Beltline ramp termini could help mitigate localized congestion in their vicinity.
- *Northwest Expressway* – with the TSP projects, the corridor is expected to operate consistent with that seen under the No Build condition.
- *River Road* – with the TSP projects, the corridor is also expected to operate consistent with that seen under the No Build condition.
- *6th and 7th Avenues* – Even with the implementation of EmX, this couplet is expected to experience congestion through much of its length and at many of its key intersections.

- *Franklin Boulevard* – this corridor is expected to experience slight improvements in congestion levels as compared to the No Build and operate primarily under or near capacity.
- *Beltline Highway* – with the construction of the local arterial bridge and other TSP projects, this corridor could see minor improvements to congestion levels as compared to the No Build. However, much of the corridor between I-5 and the Northwest Expressway is still projected to operate at or over capacity. Widening of the corridor between Roosevelt and West 11th Avenue could enable the corridor function under capacity along this segment.
- *Coburg Road* – this regional corridor is expected to operate in a manner similar to that described in the No Build.
- *Amazon Parkway/30th Avenue* – this corridor is also expected to experience similar congestion levels as shown in the No Build.
- *River Crossings* – like the No Build, all of the vehicular crossings of the Willamette River are expected to be at or over capacity in Eugene and Springfield even with implementation of the TSP projects.

Like the corridors, many of the key intersections are expected to experience congestion and/or not meet State or City operating standards. At some of these locations, the City and/or ODOT may want to consider the adoption of alternative vehicular mobility standards and/or level of service standards in attempts to balance multimodal quality of service and adjacent land use needs. These are outlined below.

- *Highway 99/Randy Pape Beltline westbound ramp terminus* – this signalized intersection is projected to operate at a level of service (LOS) "B" and a volume-to-capacity ratio (v/c) of 0.91, exceeding ODOT's mobility standard of 0.85 but still operating well within city LOS standards.
- *Roosevelt Boulevard/Randy Pape Beltline* – even with significant widening of the intersection approaches, the intersection is projected to operate at LOS "E" and a volume-to-capacity ratio of 0.93.
- *Roosevelt Boulevard/Highway 99* – if a second northbound left-turn is added, the intersection is projected to operate at LOS "E" and a volume-to-capacity ratio of 0.95. This still exceeds ODOT and City standards but still allows the intersection to operate below capacity.
- *Coburg Road/Oakway Road*– this signalized intersection is projected to operate at a level of service (LOS) "D" and a volume-to-capacity ratio (v/c) of 0.94, exceeding ODOT's mobility standard of 0.85 but still meeting city LOS standards.
- *Coburg Road/Country Club Road*– this signalized intersection is projected to operate at a level of service (LOS) "F" and a volume-to-capacity ratio (v/c) of 1.09. This intersection

would require significant reconstruction to meet standards if the traffic volumes reach the forecast year 2035 levels.

- *6th and 7th Avenue couplet intersections* – these corridors already have three to four through lanes in the east-west direction at all of the locations studied. This couplet may require additional signal timing and technological improvements to help with vehicular flow without impacting the multimodal environment.
    - Along 6th Avenue, the Garfield Street and Madison signalized intersections are projected to operate at LOS "B" and under capacity but exceed ODOT's 0.85 mobility standard.
    - The intersection of 6th Avenue/Chambers Street is expected to operate at LOS "F" and a volume-to-capacity ratio of 1.03.
    - Along 7th Avenue, the Jefferson Street, Chambers Street, and Washington Street intersections are projected to exceed ODOT's mobility standard of 0.85 but operate below capacity and with a LOS of "E" or better.
- West 11th Avenue – many of the intersections between Beltline Highway and Chambers Street are projected to operate at or over capacity and exceed the city's LOS standard of "D" even with implementation of EmX. The intersection results are slightly better than the No Build. This corridor may require additional technological solutions to provide as efficient of movements for vehicles as possible while preserving the cross-section identified during the Environmental process. The projected intersection volume-to-capacity ratios are:
    - Randy Pape Beltline/West 11th Avenue = 1.45
    - S Bertleson Road/West 11th Avenue = 1.35
    - Bailey Hill Road/West 11th Avenue = 1.25
    - Seneca Road/West 11th Avenue = 1.1
    - Chambers Street/West 11th Avenue = 1.03 although the delay is associated with level of service "D", thereby meeting city standards
- Garfield/West 13th Avenue – this intersection is forecast to operate well over capacity in its current configuration; the city may need to review alternative configurations at this location as well as potential level-of-service considerations.

In addition to the alternative standards considerations, additional analysis will be needed to determine the appropriate traffic control and lane configuration at the new local arterial bridge/Beltline Westbound off-ramp terminal/Delta Highway intersection as part of the ongoing Beltline Facility Planning efforts.

CONCLUSIONS

The City of Eugene, City of Springfield, Lane County, Lane Transit District, Central Lane MPO, and ODOT will need to continue to work together to investigate and implement future multimodal improvement projects, policies and programs that provide for a balanced transportation system. On many of the key city-wide and regional corridors, the high levels of projected vehicular travel demand will not be met by the widening of roadways. As such, the City and ODOT should consider alternative mobility and/or level-of-service standards at the locations outlined below.

State Facilities

- Consider adopting a standard of 0.99, consistent with the Portland Metro region at the following locations: Randy Pape Beltline/Highway 99 ramp termini; Randy Pape Beltline/Roosevelt Boulevard; Highway 99/Roosevelt Boulevard; Coburg Road/Oakway Road; 6th Avenue/Garfield Street; 6th Avenue/Madison Street; Chambers/7th Avenue; Jefferson/7th Avenue; and Washington/7th Avenue.
- Adopt a standard of greater than 1 at the following locations: 6th Avenue/Chambers Street; Randy Pape Beltline/West 11th Avenue.

City Facilities

- Consider adopting a level-of-service "F" standard at the following locations: S Bertelsen Road/West 11th Avenue; Bailey Hill Road/West 11th Avenue; Seneca Road/West 11th Avenue; Garfield Street/13th Avenue; and Coburg Road/Country Club Road.

Further, the efficiency of the existing transportation system will need to be maximized through transportation system management (TSM) improvements, connectivity improvements, multimodal improvements, and TDM strategies. These strategies, in combination with the identified TSP projects, will provide benefits to the city's and the regional multimodal Transportation System.

MEMORANDUM

Eugene Transportation System Plan

Project Evaluation Approach

Date:	January 8, 2014	Project #:10296
To:	Kurt Yeiter, City of Eugene Eugene PMT, TAC, and TCRG	
Cc:	Terra Lingley and Kristin Hull, CH2M Hill	
From:	Julia Kuhn, Kittelson & Associates, Inc.	

This memorandum describes the approach used to categorize and evaluate projects that may become the key elements of the recommended Transportation System Plan (TSP). The overall approach and categorization result from the TSP goals and objectives, and Eugene's commitment to creating a plan that supports its sustainability goals including the sustainability Triple Bottom Line (TBL; environment, equity, and economy).

The following goals developed during Phase 1 of the TSP guide this process:

- **Goal 1:** Create an integrated multimodal transportation system that is safe and efficient; supports local land use and economic development plans; reduces reliance on single-occupancy automobiles; and enhances community livability.
- **Goal 2:** Advance regional sustainability by providing a transportation system that improves economic vitality, environmental health, social equity, and well-being.
- **Goal 3:** Strengthen community resilience to changes in climate, increases in fossil fuel prices, and economic fluctuations through adaptations to the transportation networks.
- **Goal 4:** Distribute the benefits and impacts of transportation decisions fairly and address the transportation needs and safety of all users, including youth, the elderly, people with disabilities, and people of all races, ethnicities and incomes.

Consistent with the TBL and the TSP goals, the City's priorities for the transportation system (in no particular order) are:

- Safety
- Quality of the transportation facilities (ensuring comfortable environments for all modes within the overall transportation network)
- Supporting Envision Eugene's Key Transit Corridors and planned densities.
- Completing networks for all modes
- Understanding the tradeoffs associated with transportation project and network decisions

The categorized project list supports the above priorities and suggests timeframes for implementation based on complexity, likely available funding (including potential funding sources), and staff assessment of probable timelines. The five project priority categories include:

- 20 year projects,
- Beyond 20 year projects,
- Projects to complete upon development,
- Studies, and
- Operational projects.

In addition to the project lists, policy statements comprise an essential component of the TSP and will guide the City in future decision-making efforts as they relate to project prioritization, understanding trade-offs, and helping the city to progress toward achieving triple bottom line objectives. These policy statements are not evaluated in this memo but rather will be used to support the implementation of the TSP. Appendix A of this memo includes a preliminary list of policy concepts that may be included in the TSP.

Further discussion about each of the five project categories, and a description of how bicycle and pedestrian facilities will be handled, is provided below. A list of projects included in each category follows.

Bicycle and Pedestrian Projects

Specific bicycle and pedestrian projects are not proposed for inclusion in the TSP, with one primary exception as described below. Instead, the recently completed Pedestrian and Bicycle Master Plan (PBMP) will be adopted separately and incorporated by reference as part of the TSP. The TSP will reference the general types of pedestrian and bicycle projects and policies included in the PBMP and may specifically reference some of the key projects/policies, but the project list and priorities will be detailed in the PBMP. Further, the TSP will describe the relationship between the two documents and articulate that the PBMP represents the pedestrian and bicycle elements of the TSP. Supporting text/policies can provide the city the flexibility to update the PBMP over time without having to amend the TSP.

The potential for a grade-separated pedestrian/bicycle overcrossing of the Beltline Highway may be evaluated using TSP criteria and included explicitly in the TSP. This, the most expensive pedestrian and bicycle project being contemplated, fulfills a major gap in the existing pedestrian and bicycle system, and requires coordination with the street system and careful consideration of potential land use impacts.

Many of the projects identified in the TSP project lists will include pedestrian and bicycle components as part of the overall improvement and therefore be included in the TSP.

20 Year Projects and Upon Development Projects

Most of the projects in the 20 year and "upon development" categories provide incremental, local changes, and while they will improve specific areas, very few "move the dial" on achieving greenhouse gas reduction targets or other city-wide priorities. These projects will be evaluated by bundling them together to show the city-wide benefit of systematically implementing them over the 20 year planning horizon. Cost estimates and transportation modeling for the 20 year projects will help inform the evaluation discussions.

Projects that are to be completed upon development are those that are likely needed as properties in the urban growth boundary develop or redevelop. The timing of these projects is uncertain and they are unlikely to be advanced by the city in the absence of specific private development activities. Typically, these projects address only localized multimodal transportation needs associated with newly developing or redevelopment areas. These projects will be included in the transportation modeling and the cost estimating but most are not of the scale/nature that will inform the evaluation discussions.

The list of "upon development" projects reflects City staff's current understanding of likely priorities in these areas. At the time that specific land use applications are submitted, additional or different provisions may be required as conditions of approval based on the specifics and timing of the actual development application. Further, the projects in this category may be funded through a variety of sources, such as urban renewal, proportionate sharing (based on level of anticipated impact of a specific development), etc.

Projects Beyond 20 Years

Projects beyond 20 years are still important to consider, as they are the larger more complex projects, or projects that could address future transportation issues that are not yet problematic. This provides a clear path for the City to work towards beyond the immediate plan priorities. Inclusion of projects in the beyond 20 year category provides the city flexibility to re-evaluate priorities and to pursue a variety of funding opportunities that may arise over the life of the TSP. In terms of projects beyond 20 years, the regional land use and transportation model may be used to provide a sensitivity analysis on the traffic benefits/impacts of a new river crossing in Eugene. No other beyond 20 year projects will be modeled.

Study Projects

Study projects are those that need further analysis prior to identifying a specific project for implementation and inclusion within the TSP.

Operational Projects

Operational projects are typically intersection-related improvements that are individually lower in cost than other projects being contemplated and generally do not require right-of-way acquisition. The TSP is not all-inclusive of the operational projects the city will pursue over the life of the TSP. Rather, these projects represent those that the city can pursue to improve the operational efficiency of specific intersections and roadways. Further, a list of Transportation System Management and Options (TSMO) strategies will be included in the TSP to assist city staff and policy makers in future discussions regarding capital funding/project priorities.

PROJECT EVALUATION CRITERIA

Evaluation criteria are used to differentiate and identify trade-offs among feasible ideas and determine how well a project meets TSP objectives. To be most effective, these criteria should be measurable and well-defined. This ensures a common understanding of each criterion's meaning, and allows for a clear comparison among different ideas. The TSP criteria listed in Appendix B are organized by project objective, nested into the following eight categories:

1. Safety and health
2. Social equity
3. Access and mobility for all modes
4. Community context
5. Economic benefit
6. Cost effectiveness
7. Climate and energy
8. Ecological function

Evaluation questions are provided for each objective. Each project is evaluated in response to these questions to determine how it meets the objective. The following rating scale is used.

Evaluation Results Rating Scale

●	The project idea addresses the criterion and/or makes substantial improvements in the criteria category
◒	The project idea partially addresses the criterion and/or makes moderate improvements in the criteria category
○	The project idea does not support the intent of, provides minor or incidental benefit and/or negatively impacts the criteria category
N/A	The project idea neither meets nor does not meet intent of criterion. The project idea has no effect, or criterion does not apply

NEXT STEPS

Draft project lists, by category, will be discussed with the TCRG in February 2014 for refinement/revision. A more detailed evaluation of the 20 year projects that result from this meeting(s) will inform discussions about trade-offs and a recommended set of projects for inclusion into the TSP by project category.

The project lists are shown below. A preliminary assessment of the 20 year projects relative to the evaluation criteria follows the lists.

PROJECTS WITHIN 20 YEARS

Figure 1 shows these projects.

West Eugene EmX	
1	The West Eugene EmX extension along West 6th, 7th, and 11th Avenues is funded and underway.
River Road	
2	Improve frequent transit service and multimodal travel along River Road
3	Include a new corridor terminus with bus transfers and auto and bike parking near River Road and Randy Pape Beltline Interchange
Coburg Road	
4	Improve frequent transit service and multimodal travel along Coburg Road and transit connections to Springfield
5	Investigate transit route options for access into downtown via or around the Ferry Street Bridge
MLK	
6	Improve or maintain frequent transit service and multimodal travel along Martin Luther King Jr. Boulevard to Centennial Boulevard in Springfield
30th/Amazon	
7	Provide continued improvements to transit (frequency, service hours, transfers) to achieve frequent transit service and improved multimodal travel in this corridor between downtown and Lane Community College, including 30th Avenue.
Beltline Expressway Management Plan Recommendations[1]	
8	Provide improvements to Beltline Highway, Delta Highway and arterial street system in the vicinity as documented in the Beltline Facility Plan (adoption pending Spring/Summer 2014).
Urbanization of Existing Streets[2]	
9	Upgrade Bertelsen from 18th Avenue to Bailey Hill Road
10	Upgrade Bethel from Highway 99 to Roosevelt
11	Upgrade the north/south section of County Farm Loop
12	Upgrade W 11th from Terry to Green Hill
13	Upgrade Hunsaker Lane/Beaver Street (county has STIP-U funding for a planning/preliminary design study for this project
14	Upgrade Jeppesen Acres Road from Gilham to Providence

[1] Specific improvements will be incorporated into draft TSP once the Facility Plan has been finalized and adopted. These projects are evaluated using the criteria established for the Beltline Facility Plan and are not evaluated using the TSP criteria.

[2] These types of projects may include new pedestrian facilities, bicycle facilities, turn/travel lanes, curb/gutter, drainage treatments needed to align with current city standards and/or policies. Often, these types of projects are referred to as "urban upgrades

Other Projects	
15	Reconstruct Franklin Boulevard as a multi-way boulevard between Walnut Street and Onyx Street
16	Add lanes on the Randy Pape Beltline from Roosevelt to W 11th and provide intersection improvements at the Beltline/W 11th and Beltline/Roosevelt intersections
17	Provide grade-separated crossing of the Beltline Highway for pedestrian and bicycle travel in the vicinity of York or Park
18	Add center turn lane on Martin Luther King Boulevard between Parkway West and Centennial Loop West

PROJECTS BEYOND 20 YEARS

Figure 2 shows these projects.

Urbanization of Existing Streets[3]	
30[4]	Upgrade Summit Drive from Fairmont to Floral Hill Drive
31	Upgrade Van Duyn Road from Western Drive to Harlow Road
Intersection Projects	
32	Provide improvements to address safety and congestion at the Highway 99/Roosevelt Blvd. intersection
Beltline Corridor	
33	Improve frequent transit service along the Randy Pape Beltline corridor – with a possible Crescent Avenue route.
River Crossings	
34	Address an aging Ferry Street Bridge structure (replace in kind, no expansion)
NW Expressway	
35	Provide improvements to provide facilitate freight along the NW Expressway corridor

[3] These types of projects may include new pedestrian facilities, bicycle facilities, turn/travel lanes, curb/gutter, drainage treatments needed to align with current city standards and/or policies. Often, these types of projects are referred to as "urban upgrades".

[4] There are no Projects 19-29; these project numbers are held in reserve in case more TSP projects are added.

PROJECTS TO COMPLETE UPON DEVELOPMENT

Figure 3 shows these projects.

Local Connectivity	
40[5]	Connect Hyacinth Street between Irvington Drive and Lynnbrook Drive
41	Provide connection between Gilham Road and County Farm Road
42	Extend W 13th Avenue from Bertelsen to Dani Street
43	Provide connection between Enid and Awbrey
44	Extend Colton Way south past Royal Ave to connect with the future extension of Legacy
45	Extend Legacy South past Royal Ave to connect to Roosevelt Blvd. (Roosevelt extension)
46	Construct collectors and other facilities within Crow Road area needed to serve future demand/development
Urbanization of Existing Streets[6]	
47	Upgrade Arrowhead Street from Irvington Drive to Barstow Ave
48	Upgrade Awbrey Lane from Prairie Rd to Hwy 99W
49	Upgrade Bailey Hill Road south from Warren Street to the UGB
50	Upgrade Beacon Drive East from River Rd to Scenic Drive
51	Upgrade County Farm Loop West to east section
52	Upgrade Dillard Road from 43rd Avenue to UGB
53	Upgrade Fox Hollow Road South from Donald to UGB
54	Upgrade Prairie Road from Maxwell to Beltline
55	Upgrade River Loop #1 from River Rd to Dalewood St
56	Upgrade River Loop #2 from River Rd to Burlwood Street
57	Upgrade Royal Ave from Terry St to Greenhill Rd
58	Upgrade Scenic Drive between River Loop #2 to Beacon Drive East
59	Upgrade Spring Creek Drive from River to Scenic Drive
60	Upgrade Wilkes Drive from River Rd to River Loop #1
61	Upgrade Willow Creek Road south from 18th Avenue to UGB

[5] There are no projects 36-39; these project numbers are held in reserve in case more TSP projects are added.

[6] These types of projects may include new pedestrian facilities, bicycle facilities, turn/travel lanes, curb/gutter, drainage treatments needed to align with current city standards and/or policies. Often, these types of projects are referred to as "urban upgrades"

EWEB Property Improvements	
62	Provide improvements to facilitate the EWEB Riverfront Development, which may include: -Intersection improvements at 4th Avenue/Coburg Road: Signalize westbound right-turn movements on 4th Avenue and northbound through movements on Coburg Road (southbound movements would remain unsignalized) -Provision of a relocated highway-railroad crossing, in alignment with the existing 8th Street improvements including track panels, lights, gates, audible warning devices, and upgraded railroad track detection as required by ODOT Rail and/or Union Pacific Railroad -Relocation of the existing signal closest to the 8th Avenue/Hilyard Street intersection to align with the relocated railroad crossing at the existing 8th intersection -Provision of a northbound right-turn lane that will offer storage for vehicles queued on Hilyard Street during train passage. -Provide a new street connection from the overall site to High Street, about 100 feet north of 5th.

Figure 4 combines all three categories of projects: Projects Within 20 Years, Projects Beyond 20 Years, and Projects to Complete Upon Development.

STUDY PROJECTS

11th and 13th Avenues
If 6th and 7th Avenues become too congested to accommodate West Eugene EmX Service, study the need for re-routing along 11th and 13th Avenues
Local Connectivity
Extend Beaver Street north to Wilkes Drive (which is outside Urban Growth Boundary). Would be joint project with County and would require an exception to Oregon's Statewide Planning Goals if provided as a street serving all modes; a goal exception would not be required if it is only a pedestrian and bicycle facility or located inside the UGB.
Improvements to North-South Travel/Circulation south of Downtown
Evaluate north/south circulation options on the Oak/Pearl and Hilyard/Patterson couplets
River Crossings
Study ways to increase capacity over the Willamette River to address bridge crossing congestion issues.
University of Oregon
Explore ways to provide better multimodal connections between the University of Oregon/Franklin Boulevard area and the Autzen Stadium/Duck Village/Chase Gardens area
I-105 Ramps
Analyze options to address weaving, operational and safety considerations at the I-105 southbound off-ramp onto W 6th Avenue

The Beltline Facility Plan is currently underway and should be completed prior to the TSP adoption. The Facility Plan includes recommendations to the Beltline Highway, Delta Highway and adjacent arterial street system to improve safety and the long-term functionality of the Highway between River Road and Coburg Road. This study is a precursor to the National Environmental Policy Act (NEPA) process for the implementation of future projects. The recommendations from the Facility Plan will be incorporated by reference into the TSP.

OPERATIONAL PROJECTS

A sample of possible operational projects is listed below.

NW Expressway
Provide intersection improvements at the NW Expressway and Beltline ramp termini intersections
Arterial Corridor Management
Upgrade traffic signals along key corridors and at key intersections to implement Transportation System Management and Operations (TSMO) strategies that increase the efficiency of the arterial system.
Other Projects
Convert 8th to two-way between High and Washington
Complete conversion of Lawrence Street to 2-way between 6th and 13th
Complete conversion of Charnelton to 2-way for the entire length
Safety improvements at Fifth and Seneca

20 YEAR PROJECT EVALUATION

A draft evaluation of the 20 year projects is shown below. Appendix B provides further details on the evaluation criteria.

20-Year Project Evaluation

Project	Safety & Health	Social Equity	Access & Mobility for All Modes	Community Context	Economic Benefit	Cost Effectiveness	Climate & Energy
Improve frequent transit service and multimodal travel along key corridors							
River Road	●	●	●	●	●	◐	●
Coburg Road							
MLK							
30th/Amazon							
Urban Upgrades							
Bertelsen	○	○	◐	●	○	◐	○
Bethel (Hwy 99 to Roosevelt)

Rating Scale:

● The project idea addresses the criterion and/or makes substantial improvements in the criteria category

◒ The project idea partially addresses the criterion and/or makes moderate improvements in the criteria category

○ The project idea does not support the intent of, provides minor or incidental benefit and/or negatively impacts the criteria category

APPENDIX A – POLICY CONCEPTS

In addition to the goals, objectives, and project lists, the TSP will contain a set of policies. A policy is a statement adopted to provide a consistent course of action, moving the community towards attainment of its goals. The policies describe how the City will make future decisions. The following list reflects topics that could be addressed by policies in the TSP.

- Implement the Frequent Transit Network described in the Regional Transportation System Plan. Coordinate the Frequent Transit Network with Envision Eugene's Key Transit Corridors.
- Recommend a corridor-study approach to the key transit corridors in which multiple modes and access management, as well as future growth and urban design, can be addressed comprehensively. Incremental improvements may take place, but a comprehensive approach is preferred. In this context, "access management" includes physical barriers, such as median islands, that prohibit left turns from the travel lanes.
- Recognize the Pedestrian and Bicycle Master Plan (PBMP) as the guiding document for pedestrian and bicycle improvements and programs.
- Provide/support good bicycle and pedestrian connections to frequent transit lines.
- Introduce a "Complete Streets Network" by providing safe access by all modes between residences and employment, shopping, transit, and to meet daily needs. [Or use 20-minute neighborhood characterization.] Prioritize projects and programs that improve access near Key Transit Corridors and between residences, employment centers, and daily services.
- Work with emergency responders to keep Response Routes functional.
- Support better utilization of Northwest Expressway as a freight corridor and to provide improved general access to the River Road/Santa Clara neighborhoods.
- Roundabouts will be considered as a generally preferred design option *early* in a design process. The actual design and review process and roundabout standards can be developed administratively. [Note: this does not mean that we will necessarily implement roundabouts, but this policy acknowledges that roundabouts are in our toolbox and the public should not be surprised if they are installed.
- LOS-type standards that are used as a development review tool must be balanced and inclusive to address multiple modes of travel and quality of life issues that auto-focused LOS standards do not capture.
- Cross-over easements (from property to property) should be considered in future code amendments to facilitate access management and minimize the need for as many driveways.
- Support multimodal access into the downtown and other concentrated employment areas through the use of Transportation Management Associations and other innovative techniques that reduce demand for automobile travel at times of peak congestion.
- Review the parking code so that automobiles are not favored over other modes (when facilities for other modes are present). Example: reduce or eliminate the requirement for a minimum number of parking spaces along Key Transit Corridors.
- Improve multimodal connections between neighborhoods and the frequent transit network. [example: bike-share facilities and bike lockers at transit stations]
- Support and incorporate the Eugene Airport Master Plan into the TSP.

- Support more frequent, higher speed passenger rail between Eugene and Portland, Seattle, and Vancouver, BC. Retain a passenger rail station in downtown Eugene.
- Support freight by rail.
- Support ongoing improvements to the Amtrak Station, such as:
  - Provide transit service closer to Amtrak Station
  - Add two rail sidings to benefit freight and passenger rail.
- Reduce dependence on single-occupant automobile travel. Provide options and choice for those who do not, cannot, or choose not to own or drive a vehicle alone. Priority shall be given for safety improvements, starting with the most vulnerable (pedestrians).
- Support reasonable and reliable travel times for freight and movement of goods in the Eugene-Springfield region. (existing TSP policy)
- Promote intermodal linkages for connectivity and ease of transfer among all transportation modes [existing TSP policy], including intermodal transfers for freight (e.g., air, rail, and trucks).
- Use technologies to provide dependable, real time freight scheduling and corridor congestion management (e.g., messages to smart phones about expected delays, alternate routes).
- Use technologies and services to reduce reliance on privately owned automobiles (e.g., bike share, car share, ride share, telecommute).
- Explore methods of removing crashed and stalled vehicles from travel lanes more quickly.
- Re-evaluate street design standards to promote complete multi-modal street networks and provide context sensitive design options.
- Consider methods to finance filling gaps in the sidewalk network (ex: to connect new development to the broader street network and transit, gaps in developed areas with limited potential to provide sidewalks in the near term, etc.).
- Explore alternate measures to the standard Levels of Service (LOS and V/C) to describe function of streets, such as reducing time of delay, total corridor (rather than intersection) travel times, and average travel delay (rather than peak hour/peak 15 minutes).
- Support County improvements to 30th Avenue and Gonyea Road (outside of the UGB).
- Support the Regional Transportation Options Program.

APPENDIX B – EVALUATION CRITERIA

1. Safety and Health

Project Objectives	Evaluation Criteria
1. Double the percentage of pedestrian, bicycle, and transit trips by the year 2035.	Will the project or program substantively improve city-wide mode split, as reported as percentage of commute trips taken by pedestrians, cyclists, and transit?
2. Improve community health by increasing physical activity as part of the transportation system.	Is the project or program likely to increase walking or bicycling?
3. Support the reduction in quantities of harmful airborne pollutants associated with transportation.	What is the project or program's ability to reduce airborne pollutants, based on available LRAPA7 data on criteria pollutants?
4. Improve safety and security for all users, especially for the most vulnerable; strive for zero fatalities.	What is the project's ability to reduce fatalities and injuries? Will the project address known safety concern areas, provide safe and attractive pedestrian and/or bicycle facilities, and address areas that are otherwise considered unsafe? (Combined assessment)

2. Social Equity

Project Objective	Evaluation Criteria
1. Use future transportation investments to reduce or eliminate disparities between neighborhoods in access, economic benefits, safety, and health.	What impacts does the project or program have on areas with greater proportions of low income, minority, youth and/or elderly population than the city as a whole?

[7] LRAPA, Lane Regional Air Protection Agency measures particulate matter (PM2.5) and ozone.

3. Access and Mobility for All Modes

Project Objective	Evaluation Criteria
1. Foster neighborhoods where 90 percent of Eugene residents can meet most daily needs without relying heavily on an automobile.	Does the project or program improve access to typical daily destinations within a 20-minute walk, bicycle trip, or bus ride?
2. Improve the comfort and convenience of travel, especially for walking, bicycling, carpooling, and riding transit.	Does the project or program improve the comfort, safety, or convenience for walking, cycling, carpooling, or riding transit? This could include filling a gap in a sidewalk or bicycle facility, a carpool program to reach new customers, or improving safety or comfort while waiting for the bus.
3. Maintain a network of Emergency Response Streets to facilitate prompt emergency response.	Does the project improve roadway network connectivity for Emergency Response Streets?
4. Complete safe, comfortable, and direct sidewalk and bikeway networks between key destinations, transit stops, and residential areas.	Does the project idea add bicycle and pedestrian facilities linking key destinations, transit stops, and in residential areas?
5. Support Lane Transit District's efforts to provide high-capacity, frequent transit service, on the Frequent Transit Network.	Does the project add or enhance frequent transit to primary transit network, connect to primary transit network, or facilitate the ability to implement or add transit on identified future and existing transit routes? Does the project reduce or remove delays on existing transit service? Does the project increase the reliability of existing or future transit service?

4. Community Context

Project Objective	Evaluation Criteria
1. Ensure consistency between transportation investments and all relevant adopted and accepted local plans, such as: - Envision Eugene, - A Community Climate and Energy Action Plan for Eugene, - Airport Master Plan, - Long Range Transit Plan, - Pedestrian and Bicycle Master Plan, etc.	Yes/No – Is project consistent with current planning efforts?

5. Economic Benefit

Project Objective	Evaluation Criteria
1. Support redevelopment priorities by promoting compatible transportation investments along key transit corridors and in core commercial areas, including downtown.	Does the project or program reduce duration or level of delay, or increase twenty minute multi-modal access along key transit corridors and near core commercial areas?
2. Encourage infrastructure and programs that allow residents to reduce expenditures on fuel and vehicle use.	Does the project or program reduce vehicle miles traveled and/or improve speed consistency?
3. Support predictable travel times between key origins and destinations for high priority trips such as transit and regional freight movement.	Does the project or program improve travel time reliability along key transit and freight corridors (as applicable)?
4. Increase access to employment centers via foot, bike, and transit, while improving the quality of the traveling experience.	Does the project or program improve the likelihood of employees walking, bicycling, or riding transit to major employment centers?
5. Support access and visibility of businesses that rely on drive-by traffic by balancing congestion with economic development goals.	Does the project or program remove a large percentage of potential customers for a major commercial center? Does the project or program make it prohibitively difficult to access commercial areas by all modes?

6. Cost Effectiveness

Project Objective	Evaluation Criteria
1. Optimize benefits relative to public, private, and social costs over the plan's time horizon.	Does the project or program benefit the other seven categories compared to the costs (public, private and social) of the project or program?
2. Maximize the efficiency and life of the current transportation system.	To what extent does the project or program use and take advantage of existing network, preserve or maintain existing facilities, or modernize existing facilities to function more optimally?
3. Favor transportation investments that have potential funding for both implementation and ongoing maintenance.	How competitive is the project or program to receive funding from existing funding sources and potential future funding sources?

7. Climate and Energy

Project Objective	Evaluation Criteria
1. Focus on transportation programs and projects that help to: a. reduce total community-wide fossil fuel use by 50% by 2030 b. reduce vehicle miles traveled per capita by 10% by the year 2020 c. reduce community-wide greenhouse gas emissions 10% below 1990 levels by 2020	What is the potential for the project or program to affect mode split (away from cars) and/or reduce VMT? What is the potential for the project or program to improve speed consistency (without substantially reducing travel time) and thereby reduce GHG emissions?

8. Ecological Function

Project Objective	Evaluation Criteria
1. Improve water quality and lower the rate of stormwater runoff from transportation infrastructure.	What is the net change in impervious surface area (e.g., total width of facility, including sidewalks or other impervious features) associated with the project? Does project incorporate mitigation, such as runoff detention and filtration opportunities?
2. Reduce the urban heat island caused by paving that absorbs and re-radiates heat.	What is the amount of net additional paved surface? Does the project incorporate mitigation, such as additional tree canopy? What is the ROW availability and potential impacts to landscaping strips? Is the increase able to be mitigated?
3. Foster transportation investments that avoid damaging and improve habitat areas, where possible.	Does the project or program increase or decrease the functionality or quality of habitat areas?

Appendix E: Key Corridors Map

Corridor Overview

Appendix H: Design Standards and Guidelines for Eugene Streets, Sidewalks, Bikeways and Accessways (1999)

Design Standards and Guidelines For Eugene Streets, Sidewalks, Bikeways and Accessways

November 1999

INTRODUCTION

Within a city, a large share of the public right-of-way is devoted to transportation facilities. A facility may be a street, sidewalk, bikeway, or access way which is used by automobiles, trucks, transit vehicles, bicycles, or pedestrians.

This document contains design standards for arterial, collector and local streets to ensure the safe and efficient operation of each facility type for all users and judicious use of the public space. The standards contained in this document apply to new construction, reconstruction, and improvements to existing unimproved streets, except as specified in this document. The standards apply to both public and private streets unless specified otherwise.

Situations may arise where the design standards cannot be rigidly applied. Under special circumstances, some flexibility of the standards will be necessary to create a design that is sensitive to the specific needs and features of the location. For example, reconstructions of existing streets may be difficult due to the limitations of existing right-of-way. There may be trees, buildings, or other features which result in the need for a narrower street cross-section.

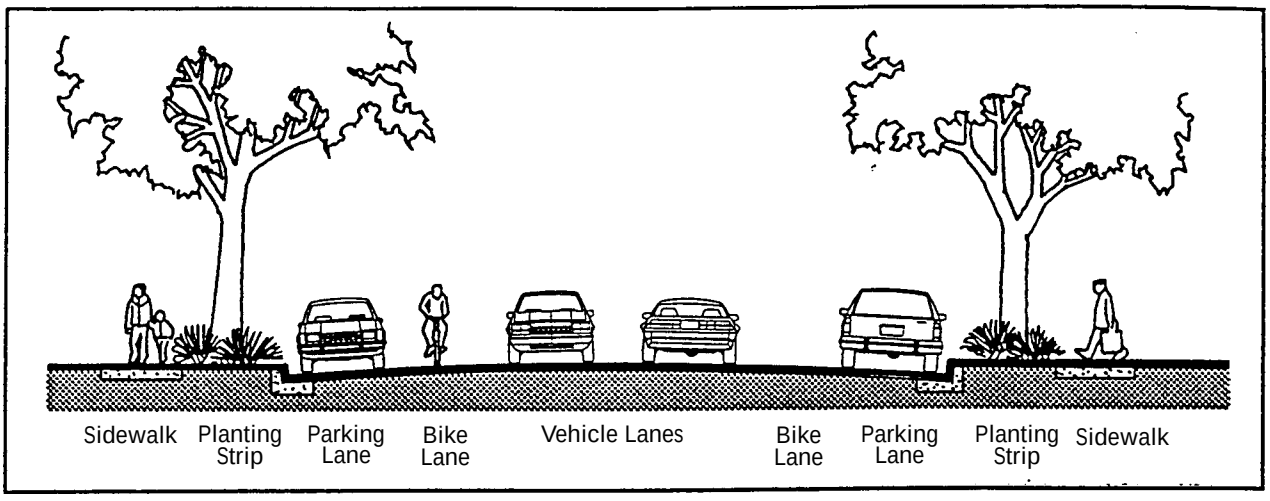
Street designs must consider the needs of people with disabilities, such as visually impaired pedestrians and pedestrians in wheelchairs. Every effort should be made to locate street hardware away from pedestrian locations and provide a surface free of bumps and cracks which create safety and mobility problems. Smooth access ramps shall be provided where required.

The determination of the pavement width and total right-of-way shall be based on the operational needs for each street as determined by a technical analysis. The technical analysis shall use forecasted demand volumes that reflect the maximum number of pedestrians, bicyclists, parked vehicles and traffic expected when the area using the street is fully developed. As the analysis identifies specific needs such as bike lanes, parking or turn lanes, the width of the street can be established.

Figure 1 illustrates elements which are typically incorporated in the transportation right-of-way such as sidewalks, planting strips, parking spaces, on-street bicycle lanes, and vehicle travel space, which may include left-turn lanes and/or median islands

The width, size, and/or design of the elements frequently differ depending on whether the roadway is classified as a local, neighborhood collector, major collector, minor arterial, or major arterial street. In the functional hierarchy of streets, collector and arterial streets are considered to be major streets. Local street types are considered to be minor streets and are further divided into sub-classifications depending on the function and location of the street.

Figure 1



ARTERIAL AND COLLECTOR STREETS

This section identifies standards for the design of Eugene's major streets; that is, those streets that function as arterials or collectors. Typically, arterial and collector streets carry significant amounts of traffic, much of it having longer trip distances and requiring somewhat higher speeds and less land use access than local streets. Arterials and collectors carry higher volumes of traffic than local streets, and require special design considerations and a high degree of inter-connectivity. At the same time, arterials and collectors must provide for public transit, bicycle, and pedestrian travel, usually at a higher level than local streets. Arterials and collectors must be designed to accommodate these users, and to provide for their safety, comfort, and convenience.

Table 1 contains a summary of typical widths for arterial and collector street elements such as right-of-way, pavement, sidewalk, bicycle lanes, and planting strip areas.

Arterial and Collector Street Standards

Table 1

Street Type	R.O.W. Width	Paving Width: No Parking	Paving Width: Parking One Side (A)	Paving Width: Parking Two Sides (A)	Setback Sidewalks (C)	Planting Strips (D)	Bicycle Lanes
Major Arterial	100'-120'	68'-94'	68'-94'	68'-94'	2 @ 6' Min.	2 @ 9'-6" Min.	2 @ 5'
Minor Arterial	65'-100'	34'-70'	34'-70'	34'-70'	2 @ 6' Min.	2 @ 8'-6" Min.	2 @ 5'
Major Collector	60'-75'	32'-44'	32'-44'	32'-44'	2 @ 6' Min.	2 @ 8' Min.	2 @ 5'
Neighborhood Collector with no Bike or Transit Facilitites	40'	20'(10/10)			1 @ 6' (B)	2 @ 7'	None
	40'		27'(7/10/10)		1 @ 6' (B)	2 @ 7'	
	45'		27'(7/10/10)		2 @ 6'	1@6'/1@7'	
	46'			34'(7/10/10/7)	2 @ 6'	2 @ 7'	
Neighborhood Collector with Bike Routes Only	45'	24'(12/12)			1 @ 6' (B)	2 @ 7'-6"	None
	45'		31'(7/12/12)		1 @ 6' (B)	1@ 7'/1@8'	
	50'	24'(12/12)			2 @ 6'	2 @ 7'	
	50'		31'(7/12/12)		2 @ 6'	2 @ 7'	
	50'			38'(7/12/12/7)	2 @ 6'	2 @ 7'	
Neighborhood Collector with Bike Routes & Transit	55'	28'(14/14)			2 @ 6'	2 @ 7'-6"	None
	55'		35'(7/14/14)		2 @ 6'	1@7'/1@8'	
	55'			43'(7/14/14/7)	2 @ 6'	2 @ 7'-6"	

A. Parking bays alternate with planting strip on Neighborhood Collectors.
B. Sidewalks on one side of the street are allowed only if the design qualifies as an exception.
C. Setback sidewalk dimension includes 5' paved sidewalk and 1' reserve strip behind the walk.
D. Planting strip dimension includes 6" curbs.

Arterial and Collector Street Types and Functions

In general, the primary function of arterial streets is to provide a high degree of vehicular mobility; however they also serve a secondary role to provide land access. Arterial streets are used as primary bicycle, pedestrian, emergency response routes, and transit routes.

Some major arterials are freeways or expressways, which have unique geometric criteria for their design and function. Because their characteristics necessitate separate design standards, they are not addressed in this document.

In general, the primary function of collector streets is to assemble traffic from the interior of an area and deliver it to the closest arterial street. Collectors provide for both mobility and access to property and are designed to fulfill both functions. They usually serve shorter trip lengths and have lower traffic volumes than arterial streets. Collector streets are also used as important emergency response routes and are frequently used as transit routes.

Arterials and collectors are divided into several sub-classifications:

- Major Arterials
- Minor Arterials
- Major Collectors
- Neighborhood Collectors

Major Arterials: Major arterials are the primary "arteries" for intra-urban travel. They provide for through travel movements and for travel from the city to outside destinations. One of the key characteristics of urban major arterials is the high degree of connectivity they provide within the urban area. These streets and highways connect various parts of the region with one another and with the "outside world", and serve as major access routes to various regional destinations. The design of major arterials typically limit property access and on-street parking to improve traffic capacity for through traffic. In Eugene, major arterials typically have four or more lanes, sidewalks and planting strips, striped bicycle lanes, and raised median islands or two-way left turn lanes.

Minor Arterials: Minor arterials also provide a high degree of vehicular mobility in that they connect nearby rural areas to cities and function within cities as conduits for a large proportion of intra-urban trips. They provide the next level of urban connectivity below major arterials. Minor arterials sometimes provide intra-regional connectivity; in most cases their main role tends to be serving intra-city mobility. In Eugene, a typical minor arterial contains two lanes plus a center turn lane, bike lanes, planting strips, and sidewalks. Some minor arterials are only two lanes wide, while others contain up to 4 lanes plus turn lanes or median islands. On-street parking is provided on some minor arterials.

Major Collectors: Major collectors assemble traffic from the interior of an area and deliver it to the closest arterial street. These streets provide for both mobility and land access to property and are designed to fulfill both functions. Major collectors are found in residential, commercial and industrial areas. Major collectors frequently have continuous left turn lanes and are normally provided with sidewalks, planting strips, and striped bike lanes; provision for on-street parking varies by location. Major collectors may be designed with raised medians to reduce conflicts, provide a pedestrian refuge, restrict turning movements, limit land access, or to furnish an aesthetic separation between traffic lanes.

Neighborhood Collectors: Neighborhood collectors are found only in residential neighborhoods and provide a high degree of access to individual properties. This street type does not apply to commercial and industrial areas, nor to most multifamily residential areas. As a rule, both right-of-way and paving widths are narrower than major collectors. Left turn lanes are only infrequently used on neighborhood collectors, and then only at intersections with higher volume streets. Neighborhood collectors are required to have sidewalks and planting strips. A great deal of flexibility exists for on-street parking on this street type. On most neighborhood collectors, bicycles share the travel lane with other motor vehicles, eliminating the need for striped bicycle lanes. Exceptions to this can occur in situations where traffic volumes or speeds, roadway geometry, or other factors suggest that striped lanes will provide a safer design.

Arterial and Collector Street Design Standards and Guidelines

The typical design elements found within the right-of-way for arterial and collector streets are: vehicle lanes, bicycle lanes (with some exceptions), drainage and curbs, planting strips, street lighting, sidewalks, and utilities. Optional features include median islands and on-street parking. All of these design elements are specified within a designated paving width and right-of-way width for each particular street, based on the specific needs and setting of that street.

Design Standards

Design standards in this document are required for the following types of street improvement projects in Eugene (unless otherwise specified in the wording of the particular standard):

- Newly constructed arterial and collector streets.
- Major reconstruction of existing arterial and collector streets, to upgrade the street to urban standards through reconstruction of the roadbed and addition of curbs, gutters and sidewalks.
- Major widening of existing improved arterial and collector streets that results in adding one or more through vehicular travel lanes.

For all other types of street improvement projects, these standards are to be considered as desirable design guidelines but are not mandatory.

The standards are not intended to apply to construction of or improvements to freeways and expressways.

Design Guidelines

In addition to spelling out the minimum design standards for arterial and collector streets, this plan also provides a set of Design Guidelines to help design professionals and the general public reach a consensus on the best possible design for any particular street improvement project. While the Design Standards can be regarded as specifying a set of "minimum tolerable" conditions for certain attributes of arterial and collector streets, the Design Guidelines found in this chapter are to be used as a working manual of best design practices for constructing, reconstructing, and improving Eugene's major street network.

Criteria for Exceptions

Design standards in this chapter must be met except when an exception can be justified through consideration of the following:

1) Topography or slope constraints;

2) Significant trees or other vegetation;

3) Other natural resource constraints, including wetlands, wildlife habitat, etc.;

4) Historic resources;

5) Insufficient right-of-way, and inability to obtain additional right-of-way at reasonable cost and within a reasonable time frame for the project;

6) Adopted Council policies, including those found in neighborhood plans.

Design exceptions might be considered for streets with topographic, vegetation, or right-of-way constraints like this street in the South Hills

Pavement and Right-of-Way Widths

Design Guidelines

1) Determination of total pavement width should balance consideration of the available right-of-way; pedestrian, transit, emergency responder, and bicyclist needs; overall street function, and traffic capacity needs.

2) Wide streets can present an impediment to pedestrian crossings. Pedestrian refuge medians and/or landscaped medians with pedestrian refuges should be designed into arterial and collector street intersections with more than three travel lanes, whenever possible, to reduce crossing distances and improve safety and comfort for pedestrians and motorists.

3) As an alternative to widening streets in built-up areas with right-of-way constrictions, consider creating paired, one-way street designs where the street layout permits.

4) Where needed, right-of-way width may be increased to accommodate high-occupancy-vehicle (HOV) lanes or exclusive transit lanes, as indicated in adopted plans.

5) Utility manhole covers and other infrastructure access elements should not be place within bicycle lanes on new streets.

6) An initial determination of required Right-of-Way and pavement widths for new street construction and street reconstruction projects will be made by City of Eugene staff.

Pavement and Right-of-Way Width Design Standards

1) Depending on the projected traffic volumes and any circumstances unique to the location, curb-to-curb pavement widths for major arterial streets typically range from 68' to 94' with total right-of-way widths ranging from 100' to 120'.

2) Curb-to-curb pavement widths for minor arterial streets typically range from 34' to 70' with total right-of-way widths ranging from 65' to 100'.

3) Pavement widths on major collector streets typically range between 32' and 44' with total right-of-way widths ranging between 60' and 75'.

4) Pavement widths for Neighborhood Collector streets range from 20' to 43' with total right-of-way widths ranging from 40' to 55' depending on a number of factors, including availability of on-street parking, need for shared use of travel lanes with bicycles, and use of the street by transit vehicles.

5) Utility placement and design of curbs and drainage facilities shall be in accordance with adopted Local Street Design Standards.

Wide streets can present an impediment to pedestrian crossings

Vehicle Travel Lane Widths

Design Guidelines

1) Travel lane width is a function of the use of the lane, the type of vehicle served, and the speed of the vehicle. All of these factors, as well as whether the lane is an “inside” lane or an “outside” lane should be considered in determining travel lane width.

2) Lane widths should be wider on higher-speed streets than on lower-speed streets.

3) Outside lanes may require a wider width to accommodate turning trucks and buses, and to reduce the effects of adjacent obstructions like parked cars. If a bicycle lane is present, outside lanes need to be wide enough to provide for safety and comfort of bicyclists adjacent to those lanes.

4) Typical travel lane widths:

a) Major Arterials. Travel lanes are typically 12' wide on major arterial streets.

b) Minor Arterials. Travel lanes are typically 11' wide on minor arterial streets.

c) Major Collectors. Travel lane widths are typically 11' wide on Major Collector streets, although wider lane widths may be required for industrial areas or other areas with significant amounts of large truck traffic.

d) Neighborhood Collectors. Typical travel lane widths on Neighborhood Collector streets range from 10' to 14'. The design width shall be determined by the use of the street: narrower lane widths are permitted on streets used only by motor vehicles; wider lane widths may be needed on streets which are used by a mix of motor vehicles, bicycles, and/or transit vehicles.

Vehicle Travel Lane Width Design Standards

1) The minimum travel lane width on Major and Minor Arterial streets is 11'.

2) The minimum travel lane width on Major Collector and Neighborhood Collector streets is 10'.

Sidewalks

Design Guidelines

1) Sidewalks and other pedestrian improvements are vital to the function of arterial and collector streets designed for multi-modal use. Walking can serve as a sole transportation mode or function as a link in a multi-modal trip. Sidewalks promote transit use by providing the link from home to bus (and vice versa). Sidewalks provide critical access to all properties; commercial, residential, industrial and public.

2) Sidewalks and other pedestrian improvements are essential components of all new street projects as well as major reconstruction projects.

3) Setback sidewalks on both sides of the street are the preferred pedestrian design choice for arterial and collector streets. Setback sidewalks:

a) provide for physical separation of pedestrians from vehicle traffic, an important consideration where pedestrians must walk next to higher speed traffic,

b) provide a safe and comfortable environment for pedestrians,

c) provide a safe and comfortable environment for motorists by fully separating pedestrians from vehicles,

d) provide for compatibility with Americans with Disability Act requirements for curb ramps and driveway aprons,

e) provide space between the sidewalk and the curb for street trees, and landscaping plantings,

f) provide a distinct green edge to the street, further distinguishing the different uses of the street and contributing to traffic calming by presenting a more attractive area of travel,

4) Alternating setback and curbside sidewalks or meandering sidewalks are an acceptable design alternative in areas where constraints (like significant trees and other natural features) and right-of-way limitations exist. In such places, on-street parking or bicycle lanes mitigate the negative impacts of curbside sidewalks.

5) Sidewalks should be located on both sides of arterial and collector streets. Where sidewalks exist on only one side of the street, access to transit is difficult and pedestrian safety as well as motorist comfort is compromised by requiring the pedestrian to cross the street to gain access to a sidewalk. This is particularly true on arterial and collector streets that have higher traffic volumes that move at higher speeds.

Missing sidewalk segment makes access to transit difficult

6) To promote pedestrian use and access to transit, sidewalks should be continuous along all arterial and collector streets. Existing gaps in the pedestrian system should be closed.

7) Sidewalks should be designed with adequate width to accommodate all existing or anticipated uses, including loading and unloading of people from on-street parking, walking traffic, window shopping traffic, bicycle parking, and use of street furniture.

Wider sidewalks accommodate more intensive pedestrian traffic in areas where pedestrian volumes are higher

Sidewalk Design Standards

1) Setback sidewalks with a minimum width of 5 feet (see Figure 2) are the standard except for the following situations:

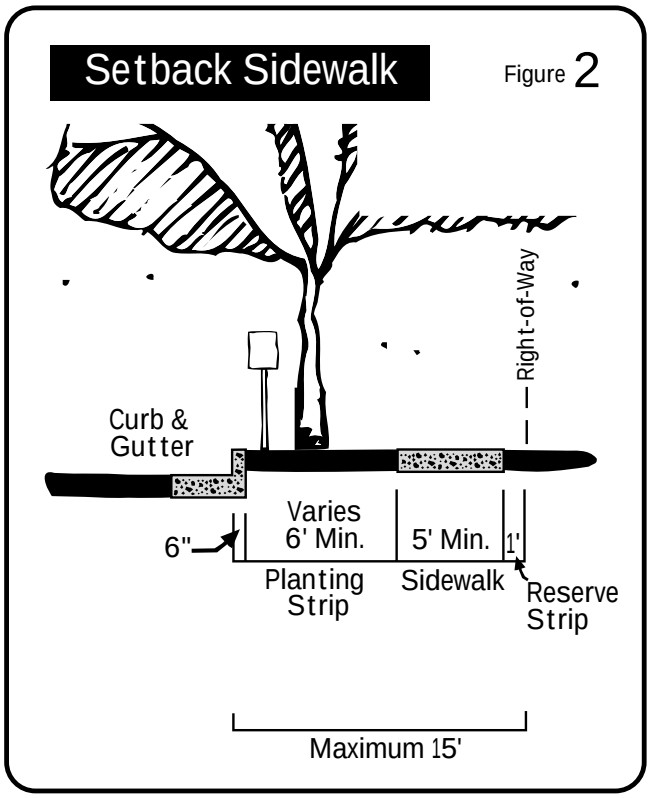
a) Alternating setback and curbside or meandering sidewalks shall be permitted in areas where constraints (like significant trees and other natural features) and right-of-way limitations exist.

b) Sidewalks in commercial areas shall be designed to provide adequate space for pedestrian travel, street furniture, and related uses. Curbside sidewalks in pedestrian-oriented commercial areas shall be a minimum of 10 feet wide, and shall incorporate tree wells in lieu of landscaped planter strips.

2) Sidewalks shall not have obstructions such as mailboxes, signs or utilities that reduce the usable width of the sidewalk below 5'.

3) Sidewalks shall be continuous along the full frontage of a development.

4) All driveway entrances and other curb cuts shall be constructed flush with the adjacent street surface.



Setback sidewalks are the preferred pedestrian design choice for Eugene's streets

Bikeways

These standards address on-street bicycle facilities. See separate standards at end of document for off-street bicycle path and accessway facility requirements.

Design Guidelines

1) Striped bicycle lanes are the preferred bikeway design choice for arterial and major collector streets to provide a high level of mobility for bicyclists. A shared roadway generally is sufficient for Neighborhood Collector streets.

2) An interconnected street system is an important factor in providing convenience and continuity of travel for bicyclists.

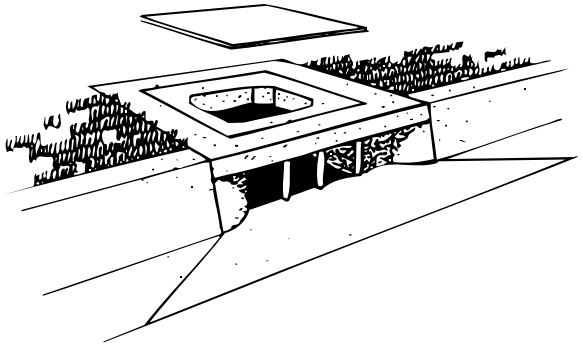
3) On-street bicycle lanes and off-street paths will be constructed in those locations indicated in adopted plans.*

4) Bicycle signing and pavement markings should be consistent throughout the bikeway system per the 1995 Oregon Bicycle and Pedestrian Plan guidelines.

5) Curb inlets are the preferred design option for storm water facilities. Where installation of curb inlets is not possible, catch basins with approved bike-proof covers are an acceptable alternative. (See Figure 3)

Curb Inlet

Figure 3



6) Avoid designing continuous right turn lanes on major streets with bicycle lanes.

** Striped bicycle lanes will be added to existing arterial and major collector streets which are already improved to urban standards only in cases where such bike lane projects on specific streets are included in the adopted TransPlan.*

On-street bike lanes provide a high level of mobility for bicyclists

Bicycle Lane Design Standards

1) Striped bicycle lanes are required on Major and Minor Arterial streets and Major Collector streets when those streets are newly constructed, are constructed to urban standards, or are widened for major vehicular capacity increases.* (These situations are defined elsewhere in this document as Major Projects, and are considered projects which may be initiated by the City if they have been included in the adopted TransPlan.)

2) Bicycle lanes shall be a minimum of 5' wide and shall be free from obstacles such as drainage grates and utility covers.

** On Neighborhood Collector streets, bicycles generally share the travel lane with motor vehicles, therefore, striped bicycle lanes are not usually required on these streets. Exceptions to this standard may occur on particular Neighborhood Collector streets, if specified in city-adopted plans or policies.*

On-Street Parking

Design Guidelines

1) Appropriate levels of on-street parking should be provided on certain streets to:

a) increase pedestrian comfort and safety by buffering pedestrians from automobile traffic;

b) support increased economic activity by increasing the visibility of storefronts and signage to motorists parking on the street;

c) support increases in development density and reduction of development costs for small business by reducing the need for on-site parking;

d) support traffic calming efforts on a street by introducing "friction" and narrowing the perceived width of the street;

e) provide spaces for on-street passenger and freight loading and unloading in intensively developed areas;

f) provide space for visitor parking in residential areas; and

g) reduce speeding by reducing the width of overly-wide streets.

2) On-street parking decreases the capacity of the adjacent travel lanes between 3% and 30% depending on the number of lanes and the frequency of parking maneuvers. Balance the demand for through-traffic movements, with local access requirements, and with the attributes listed in On-Street Parking Guideline #1, when deciding where to provide on-street parking.

3) Parallel parking is the preferred parking layout for on-street parking on Eugene's streets. On-street diagonal parking can be considered as an option in certain circumstances and on a case-by-case basis. Optimal circumstances for provision of diagonal parking include adequate overall street width and low volume, low speed vehicular traffic.

4) To avoid expensive retrofits, provide for on-street parking based on the planned, rather than the existing, land use pattern and densities.

5) Parking lanes on arterial streets may need to be wider than other streets to provide an extra margin of safety between parked cars and adjacent bicycle lanes or vehicle travel lanes.

6) On-street parking may be provided on major arterial streets only after a parking demand and supply study has been completed and the desirability and feasibility of on-street parking has been verified. A parking study shall

Parking bays, like this one on 5th Avenue, allow on-street parking while reducing overall street width

consider, among other factors, the nature of adjacent land uses, the degree to which the street is nearing design capacity, and the presence of bicycle lanes on the street.

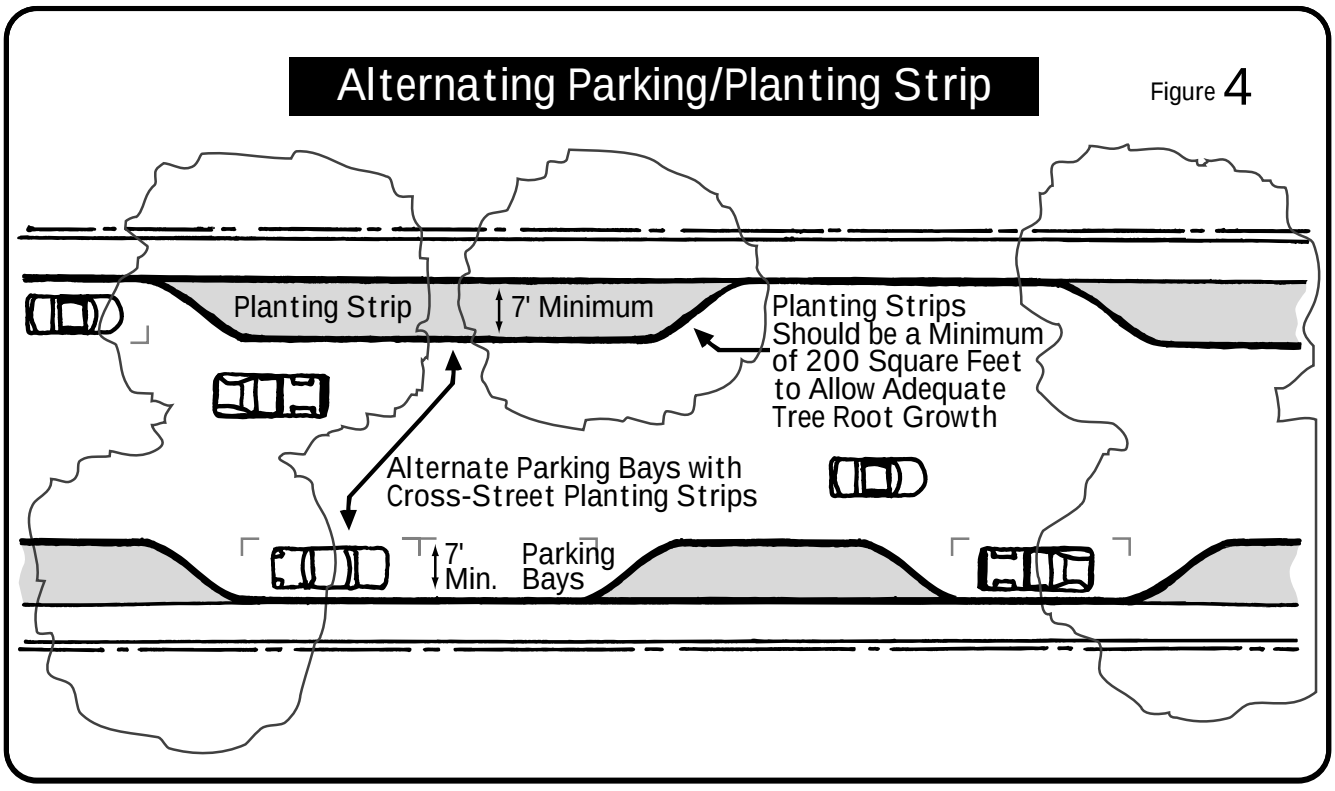
7) As a general rule, parking lanes should be marked at 7' to encourage motorists to park closer to the curb.

8) When parking is permitted on arterial or collector streets, it may be provided in parking bays which are interspersed with curb extensions and planting strips. The parking areas shall alternate with the planting strip areas as shown in Figure 4.

On-Street Parking Standards

1) Parking lane widths on arterial and collector streets shall be a minimum of 7' in width.

Major arterial streets, like Coburg Road, are designed with no on-street parking



Planting Strips and Street Trees

Design Guidelines

1) Street trees should be provided along all arterial and collector streets to:

a) Separate and define the boundaries between pedestrian areas and vehicle use areas. This separation reduces the impacts of traffic volumes and speeds on pedestrians and adjacent land uses;

b) Provide tranquility on the street, slowing the pace and intensity of street activity and enhancing the well being of pedestrians and motorists;

c) Provide shade in the summer and allow sunlight in the winter;

d) Reduce the automobile scale of major streets to human scale;

e) Provide the motorist with a vertical wall, helping motorists to gauge their speed;

f) Create an outdoor room which helps provide a sense of enclosure and security;

g) Reduce air pollution;

h) Provide identity to the street, orientation of the street within the system of streets within a city, and provide a status and prestige to addresses along the street;

i) Reinforce the design and hierarchy of the arterial and collector street system; and

j) Intercept rainfall and absorb stormwater runoff.

2) Provide continuous, uniformly and closely spaced tree plantings to create a continuous canopy along the length of and across the width of the street. Tree spacing should connect to form a continuous tree canopy over the street. A minimum spacing as low as 10 feet is possible depending on the tree species. Closer tree plantings can be achieved when the diameter of the tree trunk will remain relatively narrow.

Planting strips allow for planting of large-scale, high- canopy street trees on major streets

Motorists and bicyclists on the approach to a street must be able to clearly see between trees.

3) Street trees should be planted within center medians. Trees planted within the median reduce the perceived width of the street. This guideline does not apply when there is a strong terminating view, or in downtowns areas where strong architectural features should be allowed to dominate the streetscape.

Trees planted within median islands reduce the perceived width of the street.

4) Plant street trees in planting strips in areas with less intensive pedestrian and commercial activity, or in tree wells with or without tree grates in areas with more intensive pedestrian and commercial activity.

5) Street trees should be of mixed rather than uniform species to reduce the potential for disease killing off whole populations of trees along a street.

Tree grates are sometimes used in more urban settings

6) Large-scale, deciduous, canopy trees are preferred for street tree plantings

7) Select tree species whose canopies do not encroach into pedestrian headroom or into tall curbside vehicles such as buses.

8) Preserve existing mature trees through flexible street designs, where possible.

9) Encourage agreements with private developers and landowners to plant and maintain trees and other right-of-way plantings.

10) Ensure proper sight distance and other safety considerations in designing and landscaping planting strips. Maintenance of street trees within planting strips and medians should be ensured to avoid reduction of sight distance. Certain trees with small trunk diameters can be brought forward, especially in conjunction with the use of curb extensions.

11) Consider the potential for utilizing planting strips and medians for stormwater treatment purposes.

12) The width of a planting strip between curb and sidewalk should be based on the figures in Table 1. The minimum planting strip widths shown in Table 1 shall be regarded as strongly preferred. Total width will be determined by available (or obtainable) right-of-way, other design features, and site-specific constraints.

13) Generally, street trees shall be spaced at intervals between 10 and 50', depending on the species. The average spacing of street trees is 30'.

14) Trees at the ends of medians should be maintained with a high canopy to maintain sight distance and permit space for traffic control devices on the median nose. Median tree planting should be extended to the intersection if median widths permits and the median is not required for traffic control devices.

Routine tree maintenance is necessary to ensure healthy street trees

15) Along Minor Arterial, Major Collector and Neighborhood Collector streets, planting strips and parking lanes may be constructed within the same area, as depicted in Figure 4.

16) Street trees should be planted a minimum of 35’ from the midpoint of the tangent of the curb radius at any intersection.

Planting Strip and Street Tree Design Standards

1) Planting strips at least 6 feet wide, measured from face of curb to near edge of sidewalk, are required on both sides of arterial and collector streets.

2) Planting strips shall be used for the placement of street trees, signs, street furniture, and, to a limited degree, utilities.

3) Street trees shall be planted within the planting strip on arterial and collector streets. The planting of street trees is governed by standards and specifications in Public Works Administrative Rule R-7.280 which:

a) establishes policies and requirements for planting and establishment of street trees;

b) establishes application procedures;

c) establishes Street Tree Plan requirements;

d) establishes standards and procedures to be utilized in development of a Street Tree Plan, including standards for tree selection; tree quality; tree size; tree condition; planting location; planting procedures; establishment requirements; and tree trimming, pruning and removal; and

e) identifies trees that are permitted to be planted within the street right-of-way.

Raised Medians

Design Guidelines

1) Arterial and collector streets may have a raised median area to decrease the potential for accidents, restrict turning movements, limit land access, furnish an aesthetic separation between opposing traffic, encourage lower vehicle speeds, provide a refuge area for pedestrians or vehicles, increase the efficiency and capacity of the street, and provide space for tree and landscape plantings.

2) Medians can be used as part of an overall corridor access management strategy to reduce vehicle conflicts, increase capacity, and reduce accidents.

3) Ensure that U-turns can be negotiated at downstream intersections or median breaks when medians are used for access management.

4) Wide streets can present an impediment to pedestrian crossings. Pedestrian refuge medians and/or landscaped medians with pedestrian refuges should be designed into arterial and collector street intersections with more than three lanes, whenever possible, to reduce crossing distances and improve safety and comfort for pedestrians.

5) Medians that function to limit turns, limit land access, or reduce mid-block accidents can be relatively narrow and still provide the necessary channelization.

6) On streets with constrained right-of-way where it is desirable to provide a median for access management, pedestrian refuge, or aesthetic purposes, consider reducing the number of travel lanes in each direction, or the width of the lanes.

7) Medians should be used in conjunction with major driveway consolidations.

A landscaped median on Terry Street

Medians can be relatively narrow and still provide their intended function

8) Medians should be used for access management on main corridors and on streets with heavy traffic volumes to improve capacity and distribute traffic to side streets and to parking.

9) Coordinate placement and design of medians to accommodate maintenance operations (such as street light maintenance, utility work, etc.) and to insure adequate operating space for fire and emergency medical equipment.

10) Medians at critical intersections can have a specialized dropped, low curb where emergency responders require specialized access.

11) Landscaped medians are used to provide an aesthetic separation between travel lanes and must provide adequate room for tree root growth. The width of landscape medians is variable, depending on the varieties of trees and shrubs planted in the median. (See Figure 7)

Raised Median Design Standards

1) Standards for raised medians are the same for both arterial and collector streets.

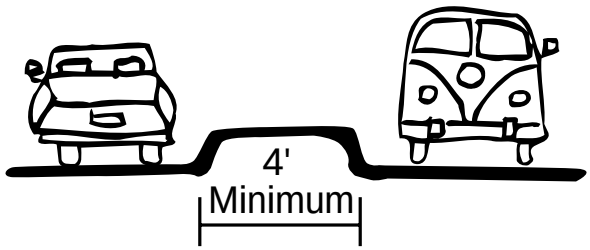
2) The preferred raised median width is 10' when used to limit land access or control turning movements. The minimum width of medians used for this purpose shall be 4'. (See Figure 5).

3) Medians used as a pedestrian refuge shall be a minimum of 6' in width to enhance pedestrian safety. (See Figure 6). Medians used as a pedestrian refuge or to facilitate pedestrian and bicycle movements shall be designed with at-grade cuts at all intersections.

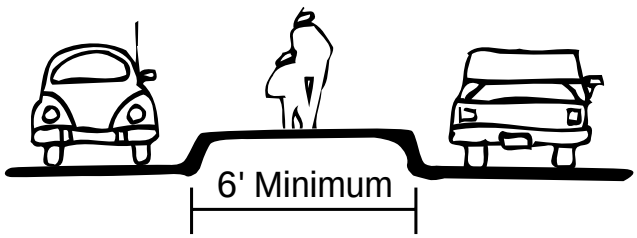
4) The preferred raised median width for provision of turning bays is 14'; the minimum width for this type of median is 12'.

5) Raised medians shall be designed at standard (6") curb height.

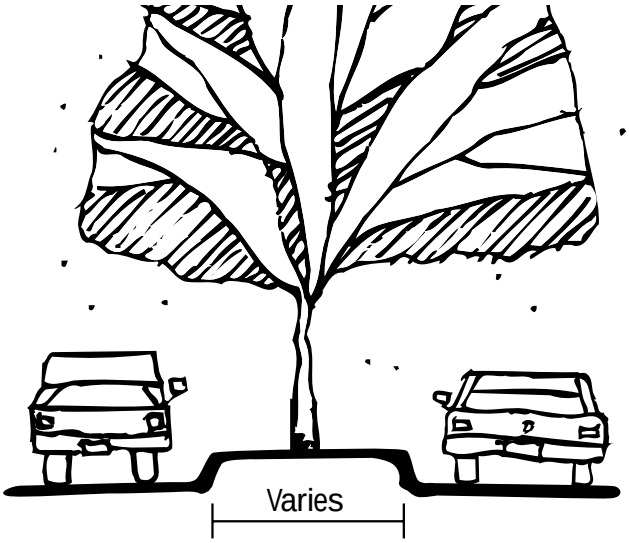
Channel Median Figure 5



Pedestrian Refuge Figure 6



Landscaped Median Figure 7



Left Turn Lanes

Design Guidelines

1) Arterial and collector streets may have a continuous two-way left turn lane to channelize and remove turning traffic from through traffic lanes, or to provide additional separation between traffic moving in opposite directions.

2) Continuous two-way left turn lanes are most useful on streets where driveways and intersections are frequent.

3) The preferred width for provision of a painted continuous two-way left turn lane is 12 feet.

4) Left turn lanes at intersections and continuous left turn lanes may be required on major collector streets in commercial, industrial, and multi-family residential areas.

5) Neighborhood collector streets shall not be designed with continuous left-turn lanes but left turn lanes at intersections with higher volume streets may be required.

Left Turn Lane Design Standards

1) All left turn lanes on collector and arterial streets shall be a minimum of 10' in width.

A center turn lane on River Road

Mid-block Crossings

Design Guidelines

1) The preferred location for pedestrian crossings is at intersections. However, mid-block pedestrian crossings can be considered and installed under certain conditions. Decisions to install mid-block crosswalks and refuges should be based on appropriate traffic "warrants" to minimize potential adverse effects of inappropriately placed crossings.

This mid-block crossing improves pedestrian safety on Willakenzie Road near Sheldon High School

2) Mid-block crossings may be used to provide street-crossing points for pedestrians on major streets in areas with infrequent intersection crossings or where the nearest intersection crossing creates substantial out-of-direction travel.

3) Where warrants are met, mid-block crossings can be used to:

a) provide pedestrians with reasonable opportunities to cross streets during periods of heavy traffic, and when there are few naturally occurring gaps in the approaching traffic streams;

b) provide pedestrians reasonable crossing places when there are long distances between signalized intersections;

c) meet the needs of pedestrians crossing between high pedestrian generators, such as a parking lot on one side of the street serving an office complex or hospital on the other side of the street;

d) provide visual cues that allow approaching motorists to anticipate pedestrian activity and unexpected stopped vehicles;

e) help channel pedestrians to the nearest available crossing point;

f) help facilitate access to and use of public transit;

g) help motorists identify important school crossings; and

h) make pedestrian behavior more predictable.

4) Generally, an engineering evaluation will be used to determine the need for mid-block crossings on major streets where one or more of the following conditions exist:

a) protected intersection crossings are spaced greater than 600 feet, or so that crosswalks are located more than 400 feet apart in high pedestrian volume locations, or areas with frequent elderly and school pedestrian traffic, and

b) speeds on the roadway are 40 m.p.h. or less with pedestrian crossing volumes (for peak four hours) exceeding 25 on streets with average daily traffic (ADT) volumes exceeding 10,000. At locations where significant numbers of pedestrians are children, elderly, or disabled, minimum crossing thresholds are 10 pedestrians per hour (peak four hours) on streets with average daily traffic (ADT)

volumes exceeding 10,000. An engineering investigation to determine adequate sight distance, traffic speeds, gap availability and pedestrian volumes shall determine the applicability of the above criteria.

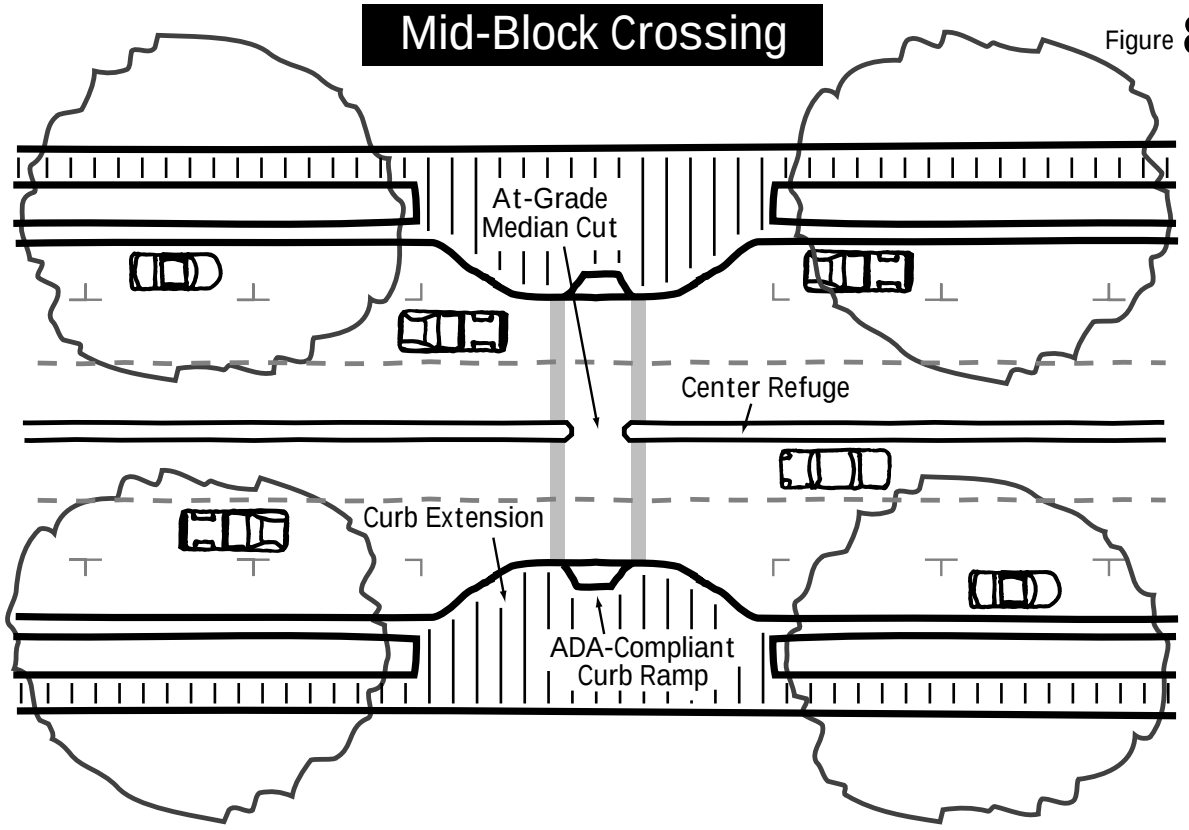
5) Where right-of-way, travel lane, and bike lane configuration allow for their construction, curb extensions and/or raised median islands should be provided at mid-block crossings to increase pedestrian and driver visibility, and to reduce pedestrian crossing distances. (See Figure 8).

6) Mid-block crossings should be marked with ladder-style (continental) markings to increase visibility.

7) The need for mid-block pedestrian crossings will be evaluated by the City of Eugene Public Works Transportation Division. A determination of the need for a mid-block crossing will be issued by the Division and will be based on relevant factors established by the Manual on Uniform Traffic Control Devices (MUTCD) including sight distance, vehicle speed, accident records, illumination, traffic volumes, type of pedestrian, nearby pedestrian generators, and other factors that are used to satisfy a warrant. Mid-block crossings may be provided with pedestrian-activated signals and appropriate advance warning devices upon a finding, based on traffic engineering study, that the location satisfies warrants established in the Manual for Uniform Traffic Control Devices. Established school crossings are high-priority locations for such studies.

Mid-Block Crossing

Figure 8



8) Mid-block crossings will be illuminated.

9) Where mid-block crossings penetrate raised medians, the median will be provided with at-grade cuts or with Americans with Disabilities Act ADA-compliant wheelchair ramps. (See Figure 8)

10) Crossing points shall be supplemented with advance crosswalk warning signs for vehicle traffic.

Ladder-style markings increase driver awareness of pedestrian crossing areas

Intersections

Design Guidelines

1) Intersection design should consider the trade-offs between increasing vehicle capacity, transit needs, and improving pedestrian and bicycle mobility and safety in situations where conflicts are evident.

2) Multi-modal intersection design should consider and accommodate appropriate level of service, design speed, and types of traffic.

3) All modes of travel should be accommodated in multi-modal intersections. Intersection widening for additional turn lanes to relieve congestion should provide for and encourage transit movements, as well as safe pedestrian and bicycle movements.

4) The preferred location for pedestrian crossings is at intersections. However, mid-block pedestrian crossings can be installed if warrants are met. (See Mid-Block Crossing Standards).

5) Wide streets can present an impediment to pedestrian crossings. Pedestrian refuge medians and/or landscaped medians with pedestrian refuges should be designed into arterial and collector street intersections with more than three lanes, whenever possible, to reduce crossing distances and improve safety and comfort for pedestrians.

6) Generally, provide striped crosswalks at stop controlled intersections when the minimum hourly pedestrian crossing volume (for peak four hours) exceeds 25 on streets with average daily traffic (ADT) At locations where a significant number of pedestrians are children, elderly, or disabled, minimum crossing thresholds are 10 pedestrians per hour on streets with average daily traffic (ADT) identified in the above cited references. Use this guideline as long as the basic criteria governing sight distance speeds, etc. are met. For details regarding this guideline, see references cited in the Mid-Block Crossing section.

7) Median signal heads and pushbuttons should be considered for placement on unusually wide intersections.

8) Provide right lanes at intersections for buses to use for “queue jump” operations. The lane may be exclusive to transit or could include other vehicles sharing the right turn lane. Additional widening on the far side of the intersection should be considered for far-side bus stops and bus merge areas.

9) Avoid intersection designs with dual right-turn lanes, particularly with one of the lanes being a shared through-right turn lane.

Areas with multiple curb cuts increase accident potential and reduce the efficiencya of the street

10) Reduce crossing widths at intersections by either providing curb extensions into the street equal to the width of on-street parking (but not interfering with bicycle lanes) or reduce curb return radius to the maximums stated under the curb return radius section. Exceptions include narrow streets with short crossings, intersections with exclusive right turn lanes, or intersections with a high volume of right turning trucks and buses. (See Figure 9).

11) Extend bicycle lanes up to intersection stop bars or crosswalks. Where bicycle lanes cross through intersections, “skip” markings shall be used to delineate the lane.

12) At intersections with exclusive right-turn lanes, the bicycle lane should be placed to the left of the right-turn lane.

13) Provide bicycle crossing intervals at signalized intersections to accommodate a 10 m.p.h. crossing.

14) Design of any curb return should consider its “effective” radius provided by the presence of bicycle lanes, parking, and other details before increasing radius size to accommodate bus or truck use.

15) The design of curb return radii should take into account the width of the two intersecting streets, the design vehicle (such as an LTD bus), lane widths, presence of bicycle lanes or on-street parking, etc. In each case, LTD staff and Transportation Division staff shall be consulted to determine the smallest acceptable radius for the benefit of pedestrian and bicycle movement, that adequately provides for bus and truck turns at the intersection. (See Figure 26 in Transit Facilities section of Design Standards and Guidelines).

16) Design of channelized right turn islands (slip lanes) can be considered in locations where street crossing distances, traffic volumes or traffic speeds jeopardize pedestrian safety or comfort. (See Figure 11).

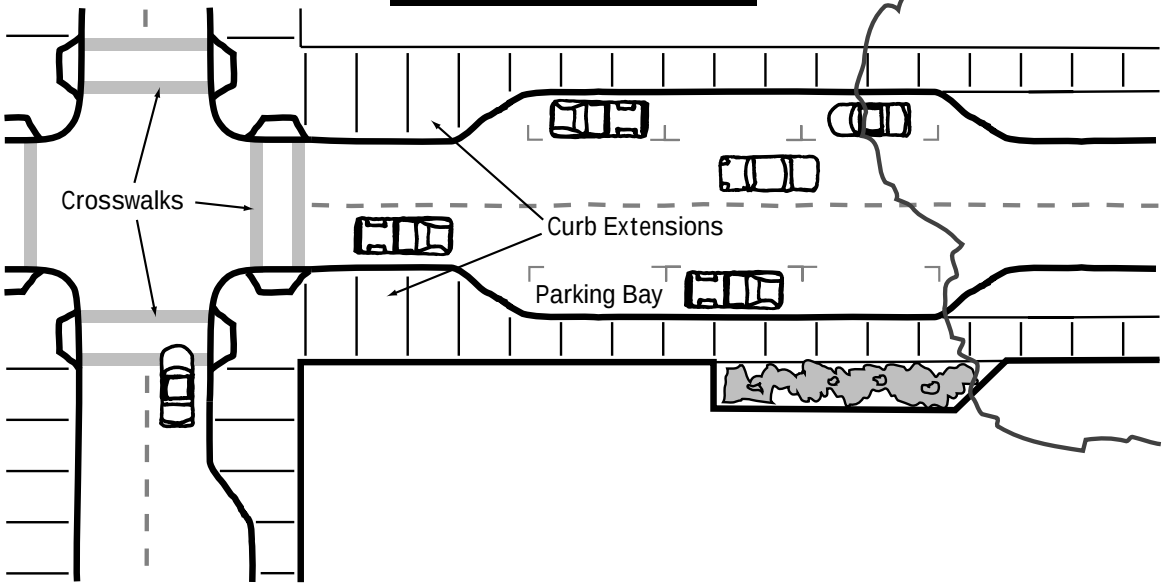
17) Striped crosswalks are to be used:

a) at all signalized pedestrian crossings

b) at all intersections on designated school routes

Curb Extensions

Figure 9



18) Avoid striping crosswalks at unsignalized intersections with inadequate sight distance. Either mitigate the inadequate sight distance or direct pedestrians to alternative crossing locations. Minimum intersection sight distance is based on local, state, or AASHTO guidelines.

19) If a raised median nose extends into the crosswalk, provide an ADA-compliant channel through the median.

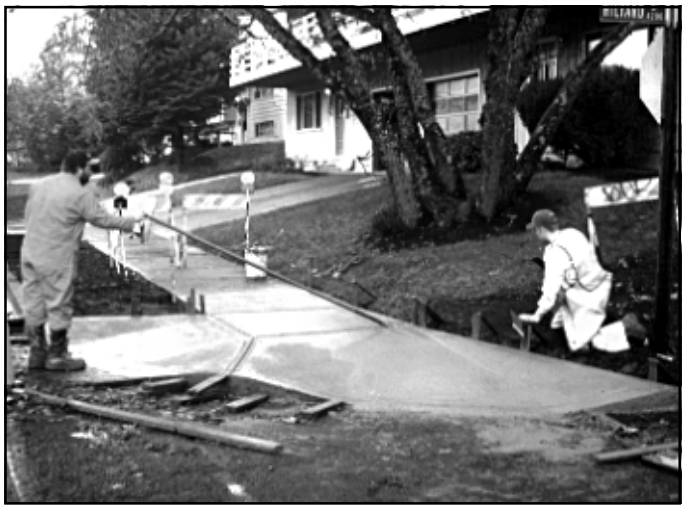
20) Use local, state, or AASHTO guidelines to determine decision and stopping sight distance triangles at uncontrolled and stop controlled intersections before striping a crosswalk.

21) Provide illumination for intersections with striped crosswalks.

22) Signal timing for pedestrians shall be based on MUTCD standards.

23) Provide signal heads (Walk/Don't Walk) at all signalized intersections, except where pedestrian movements are prohibited.

Push buttons at signalized crossings improve conditions for pedestrians



Curb ramps improve street access for those who use wheelchairs

24) Provide pedestrian pushbuttons at all vehicle activated signals except where pedestrian movements are prohibited.

25) Provide pedestrian pushbuttons and signal heads on median refuges at signalized intersections where median refuges are used.

26) Provide ADA-compliant wheelchair ramps (two per corner) at all intersections.

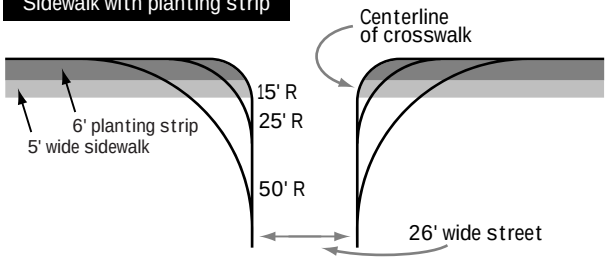
Curb Return Radii Design

Effect of Corner Radii on Pedestrian Crossing Distances

Figure 10

Setback Sidewalk

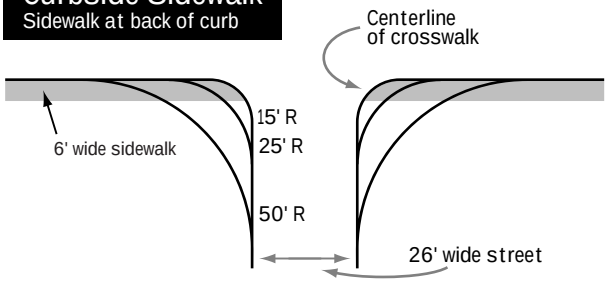
Sidewalk with planting strip



Radius	Crossing Distance	Increase Crossing	Percent Increase
15 feet	26 feet	+0 feet	0%
25 feet	36 feet	+10 feet	38%
50 feet	65 feet	+39 feet	150%

Curbside Sidewalk

Sidewalk at back of curb



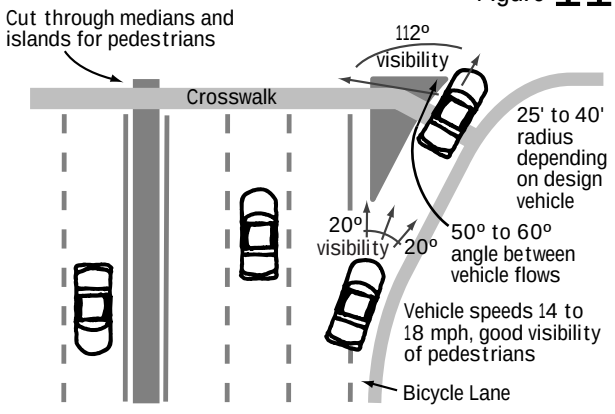
Radius	Crossing Distance	Increase Crossing	Percent Increase
15 feet	37 feet	+11 feet	42%
25 feet	50 feet	+24 feet	92%
50 feet	89 feet	+53 feet	203%

27) Install bicycle detectors at traffic-actuated intersections. Provide pavement markings identifying the location of the detector. If bicycle detectors cannot be installed, provide pedestrian pushbuttons accessible from bicycle lanes.

28) Curb return radii and the configuration of medians must be designed to facilitate pedestrian crossings, while accommodating bus and major freight movement. Primary design consideration shall be for pedestrian movements. (See Figure 10).

Right Turn Slip Lane Design

Figure 11



Adjacent Land Use

Design Guidelines

1) Site planning and design of buildings adjacent to arterial and collector streets can significantly contribute to the creation of environments that support walking, bicycling, and transit use. Site and building design is an opportunity to redirect private investment to support multi-modal transportation and increase transit ridership.

2) Buildings should face the street in all transit oriented development and nodal development areas within the city. Orienting the front entrance of buildings to the street is fundamental to increasing regional and local accessibility to transit, walking and bicycling. It also facilitates pedestrian access and supports pedestrian activity on the street.

3) Discourage residential fencing along arterial and collector streets that isolates the development from the street. Encourage residential building orientation to the street by providing for on-street parking wherever possible, and by encouraging on-site parking access via alleys.

4) Attempts should be made, wherever possible, to consolidate multiple driveways on arterial streets into single access points.

Design Standards

1) To minimize the visual and circulation impacts of extensive sections of fencing along major streets, bicycle and pedestrian accessways or street connections shall be provided at intervals not to exceed 600 feet.

Residential fencing that isolates development from the street is discouraged in the plan

Traffic Calming

Design Guidelines

1) Traffic calming techniques should be applied on selected arterial and collector streets throughout the city, as funding and opportunity permits, to address a variety of quality of life and traffic operations concerns. Traffic calming devices can be used on major streets to:

a) Keep traffic flowing at a reasonable level of service;

b) Reduce traffic speeds;

c) Reduce traffic-related noise levels;

d) Reduce traffic volumes in selected areas;

e) Ensure fair and appropriate distribution of traffic throughout a neighborhood;

f) Improve safety and travel conditions for motorists, pedestrians and bicyclists;

g) Improve traffic circulation;

h) Reduce the need for traffic regulation and heightened law enforcement in problem area;

i) Reduce air pollution levels; and

j) Provide increased opportunities for neighborhood revitalization.

2) Traffic calming techniques should not be applied in isolation. Neighborhood-wide traffic calming studies should guide the placement and choice of traffic calming devices.

3) Traffic calming devices used on major streets should not significantly reduce emergency response times or impede delivery of transit services.

4) All new major street projects and major street reconstruction projects should be evaluated for potential application of traffic calming devices and techniques to those streets.

5) All traffic calming devices should be planned and designed in keeping with sound engineering and planning practices, and with careful consideration of long-term, cost-effective maintenance.

6) All traffic calming devices should be planned and designed with significant input by residents and businesses in the affected areas.

A narrow median, curb extensions, and recessed parking calm traffic on E. Broadway, a downtown collector street

7) The following table (Figure 12) should be used as a guideline for initial evaluation of appropriate traffic calming strategies for various types of streets.

Traffic Calming on Major Streets

Street Lighting and Streetscape Features

Design Guidelines

1) The streetscape is defined as the built and planted elements of a street which define the street's character.

Street design features such as these light fixtures along 5th Ave. help define the street's character

2) Provide continuity of streetscape features along the length of any street identified as a specific district or area.

3) Provide street lighting on arterial and collector streets to:

a) Enhance safety for all modes of travel.

b) Illuminate the street and sidewalks but minimize unwanted spillover light.

c) Enhance the overall safety and appearance of the street and its immediate environment.

4) Provide pedestrian-scale lighting, where appropriate, to provide a separation from street traffic and spatial definition that is human scale. Pedestrian-scale street lights should be lower than conventional street lights, should be spaced more closely, and should provide more illumination of the sidewalk. To provide identity to certain districts, consider special light standards such as antique replicas.

5) Provide kiosks, benches, newspaper racks, trash cans, bus shelters, cafe tables, hanging flower baskets and chairs to increase the number of opportunities for people to socialize and spend leisure time outdoors along public streets.

6) Provide opportunities for "stationary" pedestrian activities. Stationary activities are either standing or sitting, where people choose to stay in a place to observe or participate in public outdoor activities. Seating can be either primary (chairs and benches, such as those found at a cafe or transit stop), or secondary seating (low walls, steps, or fountain edges, where people spontaneously collect).

Design Standards

1) Street lighting shall be provided on arterial and collector streets, in accordance with standards of the Illumination engineering Society of North America (IES).

Streetscape Features

Design Guidelines

1) Transitions occur in areas where land use type, right-of-way width, or street type change. Transitional areas provide opportunities for gateways or other design treatments that mark or signify change.

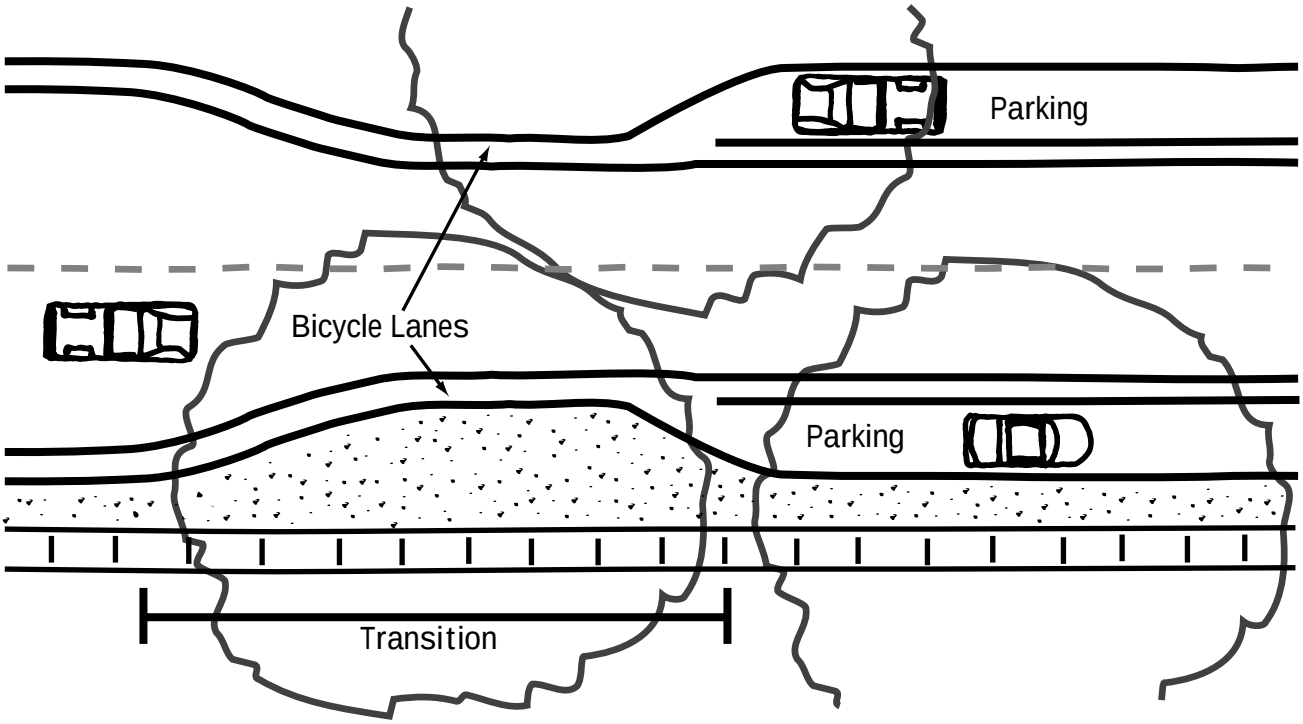
2) Street transition treatments should be located at intersections or at the boundaries of significant changes in land use.

3) Use transitional treatments to improve unattractive "leftover" areas, and to provide identity and continuity to street design.

4) Use curb extensions as a landscaped transition from wider streets to narrower streets. (See Figure 13).

Street Design Transitions

Figure 13



Use curb extensions as a landscape transition from a wider street to a narrower street

LOCAL STREETS

Local streets are the framework around which communities are built. Although the primary function of local streets is to provide access to properties fronting on the street, to a great extent, they also determine the form and character of cities and neighborhoods. The pattern and design of local streets help shape neighborhood image and identity, and can influence whether or not an area feels safe. Local streets can also influence the degree of communication neighbors have with one another, the extent to which residents use alternate modes of transportation, and the population's general feelings of well-being and comfort related to their immediate environment.

The design and appearance of local streets should convey this purpose through the use of relatively narrow widths, short lengths, frequent connections with other streets, and alignments which encourage slow traffic speeds and discourage through traffic.

Table 2 contains a summary of typical widths for local street elements such as right-of-way, pavement, sidewalks and plant strip areas, and traffic volume thresholds.

Local Street Standards

Table 2

Type of Street	R.O.W. Width	Paving Width			(Setback) Ⓐ Sidewalks	Planting Ⓑ Strips	Average Daily Traffic (ADT)
		No Parking	Parking One Side	Parking Two Sides			
1-way Alley Ⓒ	20'	12'			None	None	NA
2-way Alley Ⓒ	20'	16'			None	None	
Access Lane Ⓓ	40'		21' (7/14)		1 @ 6'	7' and 6'	<250
Access Lane Ⓓ	55'			28' (7/14/7)	2 @ 6'	2 @ 7'-6"	ADT
Low-Volume Res. Ⓓ	45'	20'(10/10)			2 @ 6'	2 @ 6'-6"	250
Low-Volume Res. Ⓓ	45'		21'(7/14)		2 @ 6'	2 @ 6'-0"	to 750
Low-Volume Res. Ⓓ	55'			28'(7/14/7)	2 @ 6'	2 @ 7'-6"	ADT
Med.-Volume Res. Ⓓ	50'	20'(10/10)			2 @ 6'	2 @ 9'-0"	>750
Med.-Volume Res. Ⓓ	55'		27'(7/10/10)		2 @ 6'	2 @ 8'-0"	ADT
Med.-Volume Res. Ⓓ	60'			34'(7/10/10/7)	2 @ 6'	2 @ 7'0"	
Commercial/ Industrial	55'-70'		30'-44'		Curbside/ Setback	2 @ 6'-0" Min.	NA

A. Setback sidewalk dimension includes a 5' paved walk and 1' strip behind the walk. For curbside sidewalks, the sidewalk dimension includes a 5' paved walk and 6" curb (5'-6" total); the 1' strip behind the walk is added to the planting strip dimension.
B. Planting strip dimension includes 6" curb. For curbside sidewalks, an additional 6" would be added to the planting strip dimension.
C. In addition to the ROW width, alleys require a minimum setback of 2' on each side for a minimum 24' backup distance.
D. Additional parking to accommodate occasional high parking demand may be provided in congregate parking areas such as parking bays.

Local Street Sub-Classifications

Local streets are divided into several sub-classifications:

- Alleys
- Access Lanes
- Low Volume Residential Streets
- Medium-Volume Residential Streets
- Commercial-Industrial Streets

Alleys: Alleys are streets that provide secondary access to residential properties where street frontages are narrow, where the street is designed with a narrow width to provide limited on-street parking, or where alley access development is desired to increase residential densities.

Access Lanes: These streets are designed for primary access to a limited number of properties. On this street type, the residential environment is dominant and traffic is subservient. Access Lanes can be constructed as cul-de-sacs, loop streets, or short streets connecting two other streets. Access lanes generally serve 25 or fewer homes and traffic volumes are less than 250 Average Daily Traffic (ADT).

Low-Volume Residential Streets: These streets are designed for primary access to individual residential property as well as access to adjacent streets. As with the Access Lane, the residential environment is dominant. Traffic volumes are relatively low (250-750 ADT).

Medium-Volume Residential Streets: These streets are designed for primary access to individual residential property and to connect streets of lower and higher function and access the major street network. These streets are designed to accommodate higher traffic volumes (750-1,500 ADT).

Commercial/Industrial Streets: These streets are designed for primary access to commercial and industrial properties and to connect to the major street network. They are designed to accommodate higher traffic volumes and freight.

Local Street Design Standards

The typical design elements found in a local street right-of-way are: sidewalk and planting strip areas, parking lanes, vehicle traffic lanes, parking lanes, drainage and curbs, planting strips, sidewalks, utilities, street lighting, and occasionally a center median. The standards in paragraphs A-M below apply to both new and existing unimproved local streets, unless otherwise stated.

A. Vehicle Lanes

1) Two 10' vehicle traffic lanes are required on local residential streets when traffic volumes are expected to exceed 750 vehicles per day.

2) On local residential streets with traffic volumes less than 750 vehicles per day, a single 14' traffic lane may be permitted for both directions of vehicular travel. The single traffic lane is intended to create a “queuing street”, such that when opposing vehicles meet, one of the vehicles must yield by pulling into a vacant portion of the adjacent parking lane. This queuing effect has been found to be an effective and safe method to reduce speeds and non-local traffic.

3) Two 12' wide vehicle traffic lanes are required on local commercial and industrial streets.

4) In special circumstances, such as where a local street intersects with a collector or arterial street, additional width may be required for safe turning movements.

B. Medians

1) Center medians are a design option for Low-Volume and Medium-Volume Residential Streets, but the street design must ensure the minimum 14' clear lane needed for fire apparatus.

2) Medians shall be landscaped with groundcover, trees, and shrubs less than 3' in height.

C. Parking Lanes

1) Parking lanes are 7' wide on local streets.

2) Additional parking to accommodate occasionally high parking demands may be provided in congregate parking areas, such as parking bays.

D. Bike Lanes

1) Because of the low projected traffic volume and speed, striped bicycle lanes are not required on local streets. However, the design shall comfortably accommodate the shared use of the roadway by bicyclists and motorized traffic.

E. Drainage and Curbs

1) Drainage inlets shall be bicycle-safe as required by ORS 810.150. Curb inlets as shown in Figure 14 shall be used unless alternate style is required or approved by the City Engineer.

2) Combined vertical curb and gutter shall be used on all streets with an enclosed drainage system.

3) A modified rolled curb with a slightly rounded top and bottom may also be used as shown in Figure 15; however, no other rolled curb designs are permitted. Gutter width shall be 18" wide measured from the face of the curb.

4) In private alleys paved with asphalt, inverted concrete curbs as illustrated in Figure 16 are required to prevent the pavement edge from breaking down. Inverted curbs are also required in Access Lanes that utilize grassed swales for drainage.

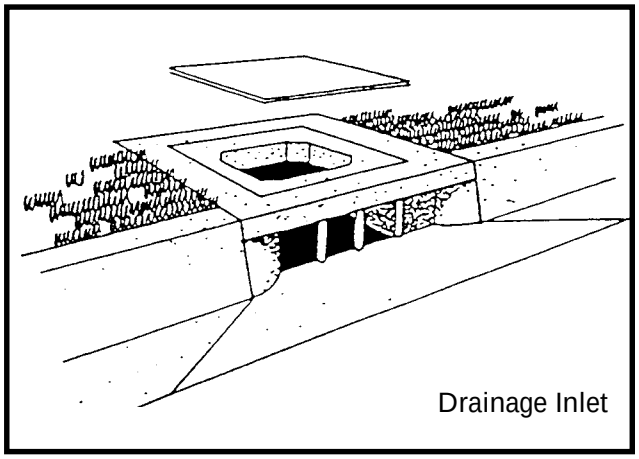
F. Sidewalks

Note: the following standards are required for newly constructed local streets, and recommended guidelines for existing local streets.

1) Sidewalks are required along all new local streets and shall be a minimum of 5' wide.

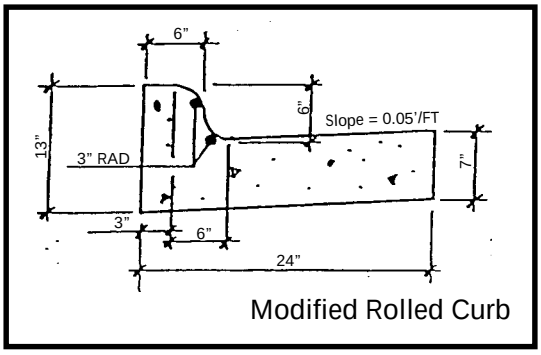
2) Generally, setback sidewalks are required along both sides of the street.

Figure 14



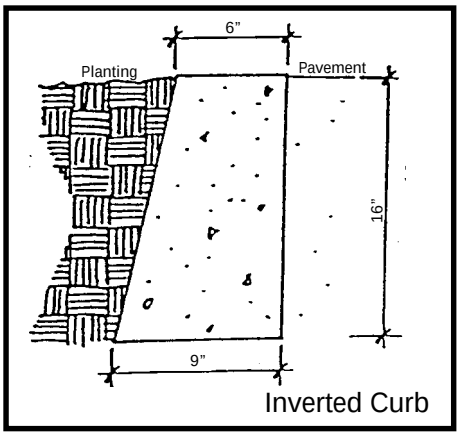
Drainage Inlet

Figure 15



Modified Rolled Curb

Figure 16



Inverted Curb

3) Setback sidewalks shall be set back from the street by a planting strip not less than 6' wide.

4) Sidewalks shall not have obstructions such as mailboxes, utility poles, or signs that reduce the usable width of the sidewalk below 5'.

5) Curbside sidewalks and sidewalks on one side of the street are permitted for Access Lanes, in special circumstances, such as to reduce excessive impacts to topography, wetlands, drainageways, and other natural features; in infill situations to match existing configurations; or on existing unimproved streets. In these situations, the sidewalk may be placed adjacent to the street to reduce overall right-of-way. Curbside sidewalks are also permitted for Commercial/ Industrial Streets.

G. Utilities

1) The primary location for utilities is in a public utility easement (PUE) adjacent to the right-of-way.

2) Utility facilities such as electric transformers, hydrants and junction boxes may be located in the planting strip, but should be sited as close to the property line as possible to avoid conflicts with street trees.

3) Utilities are required to avoid conflicts with stormwater-related conveyance and treatment facilities.

H. Street Lighting

1) Street lighting shall be provided on local streets in accordance with IES standards.

I. Pavement and Right-of-Way Widths

1) Depending on the projected traffic volumes and any circumstances unique to the location, pavement widths for local residential streets (not including alleys) range from 20' to 34', with total right-of-way widths ranging from 40' to 60'.

2) Pavement widths for local commercial and industrial streets range from 30' to 44', with total right-of-way widths ranging from 55' to 70'.

J. Cul-de-sacs

1) Maximum length for a cul-de-sac is 400 feet, measured from the centerline of the intersecting street to the radius point of the cul-de-sac bulb.

2) A cul-de-sac will normally terminate in a standard cul-de-sac bulb. In the event that a standard bulb is not feasible, a “Y” or “T” turnaround may be used.

3) Cul-de-sacs constructed with 20' of paving and more than 150 feet in length must provide a 12' emergency vehicle, bicycle, and pedestrian accessway from the bulb to an adjacent street.

K. Traffic Calming Devices

1) Occasionally it is necessary to employ various techniques to reduce vehicle speeds and/or shift traffic to more appropriate routes. These techniques are commonly referred to as “traffic calming” measures. Traffic calming measures can also be incorporated in the construction of new streets to prevent problems from developing in newly constructed or future residential areas. Traffic calming devices are intended for use on local streets but may be used on collector streets. The application of these techniques is based on a case-by-case basis using engineering judgement. Planning and design should be coordinated with nearby residents as well as emergency and other service providers who will be affected by their use. Table 3 indicates which techniques are suitable for existing and new streets.

L. Grade

1) New street grades in excess of 20% are prohibited. Maximum grade of 15% with up to 200' lengths of grade up to 20% is allowed, but there shall be no intersections or driveway access in areas with grades above 15%.

M. Private Streets and Alleys

1) Private local streets are required to be designed to the same standards as public streets in the following categories:

a) Intersection configuration (spacing and intersection angles).

b) Minimum centerline radius length (American Association of State Highway and Transportation Officials (AASHTO) standard).

Traffic Calming Device Locations — Table 3

Traffic Calming Device	Existing Street	New Streets
Traffic Circles	■	■
Speed Hump *	■	■
Raised Crosswalks	■	■
Curb Extensions	■	■
Chicanes	■	■
Traffic Diverters ** Full Diverters - Street Closure Half Diverter Diagonal Diverter	■	
Median Barrier	■	■
Forced Turn Channelization	■	■
Parking Bays	■	■
Pavement Surface Modifications	■	■
Speed Actuated Signing	■	■

* New speed humps are to be installed only at the direction of the City Traffic Engineer.

* * Installation of diverters or street closures is subject to provisions of Chapter 5 of the Eugene Code, 1971.

c) Grade: Maximum grade of 15% with up to 200' lengths of grades up to 20%, but no intersections or driveway access in areas with grades above 15%.

d) Sight distance.

e) Width: Minimum 20 feet

f) Curb height where necessary for roof drains, safety or ADA requirements

g) Street alignments in relation to natural resource sites and water-related features.

2) Sidewalks are required, but reduced sidewalk width is allowed, curbside or meandering sidewalks that don't parallel the street are allowed, and sidewalks are allowed on one side of the street. Sidewalks must meet ADA requirements, which allows a minimum width of 3' provided that "passing space" is provided at reasonable intervals, not to exceed 200 feet.

3) Private alleys are required to comply with the standards for public alleys in the following categories:

a) Intersection configuration

b) Grade

c) Width and setback requirements

d) Curb requirements (if asphalt)

4) The structural design and construction inspection for private streets and alleys shall remain the developers responsibility. Certification by a licensed engineer that a structural design meeting the public design standards outlined above has been completed shall be submitted with the land use application.

Exceptions to Address Topography and Natural Resources

Occasionally, streets are constructed in locations which require special accommodations such as in hilly areas, or near wetlands, canals, dense vegetation, or sensitive plants and animals. In these cases, specific considerations should be made to minimize negative impacts. For example, wide streets along steep slopes require much larger hillside cuts than narrow streets.

Generally, the range of local street types make it possible to construct or improve local streets in accordance with the design standards. In certain situations, however, exceptions should be made. Exceptions could result in construction of meandering sidewalks, sidewalks on only one side of the street, or curbside sidewalk segments instead of setback walks. Exceptions are allowed when one or more of the following conditions exist.

1) Physical conditions that preclude development of a public street. Such conditions may include, but are not limited to, topography or the existence of natural resource areas such as wetlands, ponds, streams, channels, rivers, lakes or upland wildlife habitat areas, or a resource on the National Wetland Inventory or under protection by State or Federal law; or

2) Buildings or other existing development on adjacent lands, including previously subdivided but vacant lots or parcels, physically preclude a connection now or in the future, considering the potential for redevelopment.

BICYCLE/PEDESTRIAN PATHS

Bicycle/pedestrian paths are facilities that are physically separated from motorized traffic by an open space or barrier and serve a mixture of users such as cyclists and pedestrians as shown in Figure 17. Paths shall be a minimum of 12' wide with 2' wide unpaved shoulders on each side.

Concrete is the preferred surfacing, with saw cuts for expansion. Asphaltic concrete may be used, depending on soil or other conditions, such as projected use by maintenance or emergency vehicles. Pavement, sub-base and shoulder design shall be determined following an engineering analysis of the design variables and shall meet design criteria established by the City Engineer. Paths should have 3' of shy distance from the edge of the path to any fixed object.

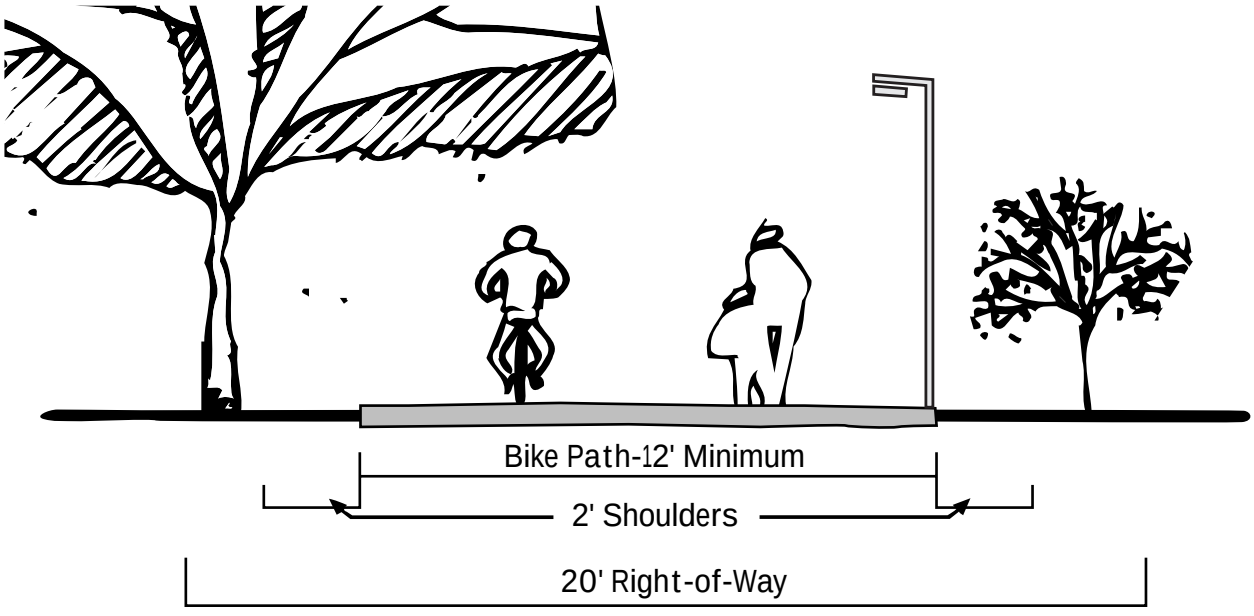
Paths shall be lit and shall comply with IES standards.

Paths shall be designed to minimize motorized traffic. Bollards are not the preferred option and should be used only if warranted. If used, bollards should be painted with white reflective paint, and should be placed in the center of the path and pavement guide separators shall be placed a minimum of 20' in front of the bollards.

The AASHTO Guide for Development of Bicycle Facilities shall be followed for other standards for bicycle path construction such as super-elevation, overhead clearance, minimum radii, lighting and sight distances.

Example Bike Path Dimensions

Figure 17



PEDESTRIAN AND BICYCLE ACCESS WAYS

Access ways are interconnecting paved walkways which provide pedestrian and bicycle passage such as between two cul-de-sacs or between subdivision plats. Access ways shall be a minimum of 10' wide on a 10' right-of-way. They shall be constructed of Portland cement concrete with a typical depth of 5" concrete over a 1" base of crushed rock. The dimensions for the pavement and crushed rock are based upon the heaviest vehicle which will use the access way and the native soil conditions. Final pavement and base design shall be determined following an engineering analysis of the design variables.

Access ways which function as a secondary fire access shall be constructed to support 55,000 pound vehicles. Fire access ways shall be paved a minimum of 20' wide on a 20' right-of-way unless a narrower width is approved by the City Manager or designee.

Access ways shall be designed to minimize motorized traffic. Bollards are not the preferred option and should be used only if warranted. If used, bollards should be painted with white reflective paint, and should be placed in the center of the path.

Access Way Dimensions

Figure 18

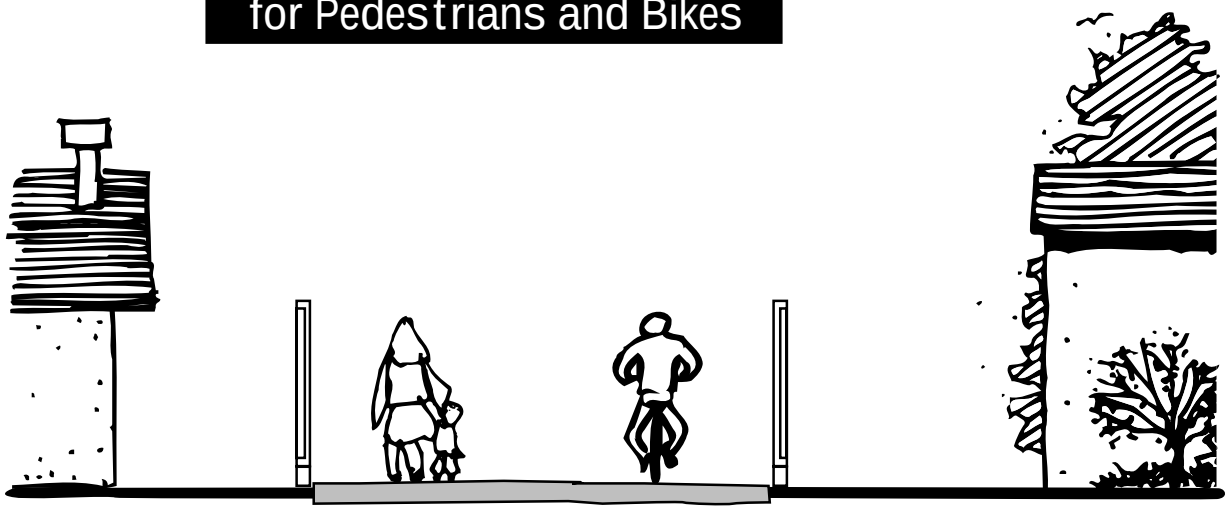
Type	Description	Pavement Width	Total Right-of-Way
Access Way	Not a Fire Access	10'	10'
Access Way	Fire Access	20'	20'

Access way surfaces shall be designed to drain water to the side or sides of the access way. Drainage systems which collect surface water along the centerline of the access way (similar to paved alleys) are not permitted.

Adequate vision clearance shall be provided at the ends of public access ways as required in Chapter 9 of the Eugene Code. Access ways shall be as straight as possible between connecting streets.

Example Access Ways for Pedestrians and Bikes

Figure 19



Appendix I: Eugene Transportation System Plan: Public Involvement Plan

Eugene Transportation System Plan: Public Involvement Plan

PREPARED FOR:	Eugene Transportation System Plan Project Management Team
PREPARED BY:	Brandy Steffen, CH2M HILL Kristin Hull, CH2M HILL
CC:	Theresa Carr, CH2M HILL
DATE:	July 8, 2010

This memo describes the proposed public involvement plan for phase 1 and 2, to support development and adoption of the Eugene Transportation System Plan (TSP). Implementation of the plan will require the support of the City of Eugene, the Oregon Department of Transportation (ODOT), Department of Land Conservation and Development (DLCD), and the Lane Council of Governments (LCOG); as well as coordination with the projects listed above. Effective documentation of public input will make it easier for the project team to incorporate community ideas and concerns, and for community members to make a connection between their input and decisions.

Goals of the Public Involvement Plan

The project is committed to an approach that is consistent with the Oregon Statewide Planning Goal 1 (Citizen Participation). The Eugene TSP public involvement approach:

- Provides early and ongoing opportunities for stakeholders to raise issues and concerns that can be considered through equitable and constructive two-way communication between the project team and the public.
- Provides complete and timely information to the public about ways to comment and help develop the TSP.
- Proactively informs and encourages the participation of all stakeholders regardless of race, ethnicity, age, disability, income, or primary language.
- Builds widespread community understanding of findings and decisions.

This document covers two components of the public involvement structure, the project teams' decision process and structure, which will remain the same for the entire project lifespan, and the public involvement process and tools, which will change during the next phase of project work.

Decision Process and Structure

This portion of the memo identifies the decision milestone, process, and decision-making structure. This information will not change over the life of the project.

A key element of the approach is a structured decision process, clear decision milestones and well-defined roles and responsibilities. Thorough and thoughtful consideration of issues at each decision point by all of the project stakeholder groups helps to ensure quality decisions that will not have to be revisited later in the project because something of significance has been omitted or improperly addressed. The clear identification of decision points creates an expectation in stakeholder groups for meeting the deadlines and staying on schedule as a way to avoid additional meetings.

Defining the decision structure—groups that will be involved and how they will participate—provides a "level playing field" for all stakeholders and answers questions typically asked by stakeholders:

- Who will make the decisions?
- How can I influence the decisions?
- When will I have an opportunity to participate?
- Who will consider my input?

Proposed Decision-Making Structure

The proposed decision-making structure for the Eugene TSP is shown on Figure 1. The composition, roles, and responsibilities of each group are described below.

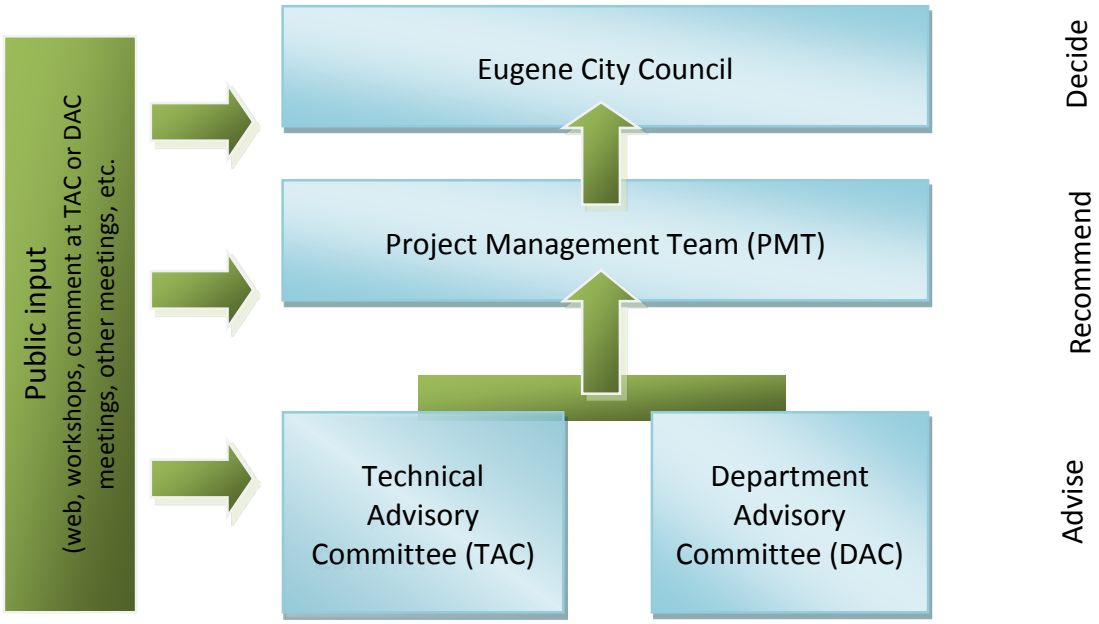


FIGURE1
Decision-Making Structure

Eugene City Council

The Eugene City Council will ultimately adopt the completed TSP. This will then be followed by Lane County co-adoption and acknowledgement by DLCD.

Technical Advisory Committee

The Technical Advisory Committee (TAC) is expected to include representatives from the City of Eugene, ODOT, Lane Transit District, Lane County, and the Eugene/Springfield School District, among others. The City of Eugene will be responsible for compiling the TAC roster. Responsibilities of the TAC include:

- Provide technical feedback at key milestones, by reviewing and commenting on the key deliverables.
- Represent the interests of their agencies or jurisdictions in group deliberations.
- Communicate project progress to their fellow elected or appointed officials, and to their constituents.
- Provide input to the PMT on technical issues related to the planning efforts.

Department Advisory Committee

The Department Advisory Committee (DAC) will provide a balanced representation of stakeholder interests, affected communities, and geographic areas as well as a communication link with those interests and communities. Members will include leaders of neighborhoods affected by the project, agency staff representatives, representatives of local and regional business groups and advocates for key interests, including different modes, environmental representatives and civic groups. The City of Eugene will be responsible for creating the DAC roster. Responsibilities of DAC members include:

- Represent their constituents' perspectives during group deliberations.
- Communicate project progress with their constituents.
- Review and comment on the key deliverables (provide input to the PMT on policy issues).
- Support the public involvement process.

Project Management Team

The Project Management Team (PMT) will be comprised of the ODOT Project Manager, the City of Eugene Project Manager, the LCOG Project Manager, and the consultant project manager, with participation from other key staff resources as needed. The PMT's responsibilities include:

- Management of project scope, schedule, and budget at a day-to-day level.
- Direction, production, and quality assurance of technical and public/agency involvement work.

- Assurance of an open, transparent process that incorporates full consideration of public input.
- Develop recommendations to the City Council.

Proposed Decision Process

The decision process for the Eugene TSP will be organized into the following decision points as described below:

- Prepare Goals and Objectives
- Develop Performance Measures and Policies
- Identify Existing and Future Need
- Identify Alternatives
- Evaluate Alternatives
- Prepare Recommendations
- Prepare and Adopt Plan

Prepare Goals and Objectives

The consultant team will work with the PMT, the TAC, the DAC, and the community to develop goals and objectives for the TSP effort. These will include what the TSP is intended to address, and how it will be addressed. Goals and objectives will serve as the basis for the performance measures and will be used to evaluate alternatives.

Develop Performance Measures and Policies

This next decision step creates supporting policies, based on goals and objectives, which serve as the basis of the TSP. It also develops performance measures to assist in evaluating and identifying alternatives. This will build from the goals and objectives and add qualitative and quantitative performance measures for gauging the effectiveness of alternatives—how well they solve the identified problems and how well they perform against the broad range of stakeholder values. The measures will be reviewed by the TAC and DAC, and discussed at a public workshop.

Identify Existing and Future Need

This decision point will ask for agreement on the description of existing and future deficiencies to be addressed by the TSP, with input from the public. The TAC and DAC will also review this statement of need. This phase will also rely on the evaluation of existing and future conditions.

Identify Alternatives

The PMT, DAC, and TAC will discuss ways to address needs through projects and programs, preferably in a workshop setting. At this point, all concepts -- alternatives or solutions that could potentially solve the identified problem – are considered. The aim is to ensure stakeholders have been consulted and all of their ideas get put "on the table."

Evaluate Alternatives

Alternatives will be reviewed in detail against the objectives and performance measures. Finally, alternatives for further study will be selected and refined. The narrowing of alternatives would reflect input gathered at a public workshop and from the TAC and DAC.

The remainder of the project decision points would be in future phases 3 and 4 of the project, for which another Public Involvement Plan would be prepared.

Proposed Schedule

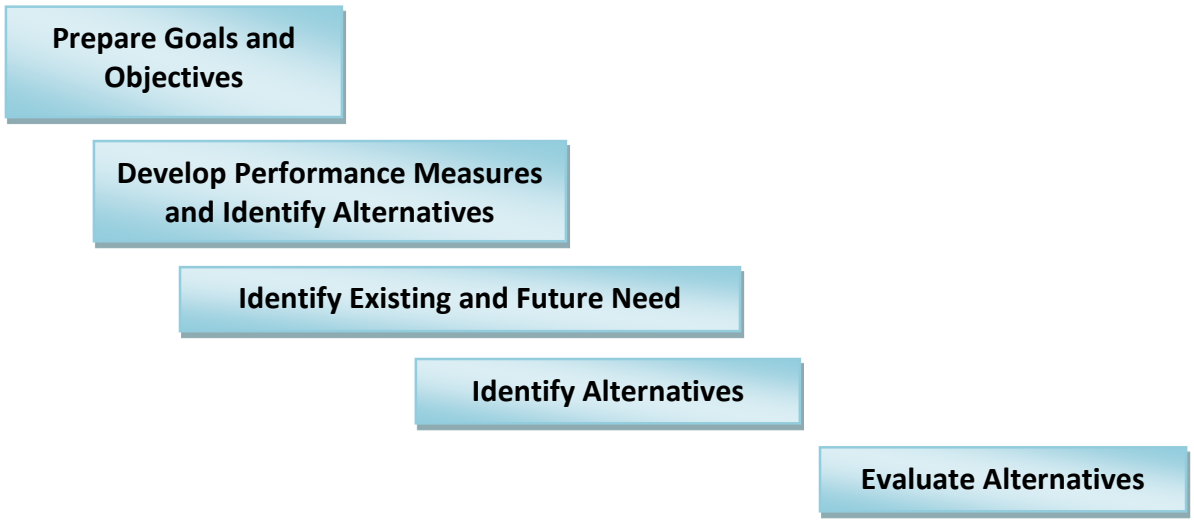

FIGURE2
Proposed Schedule

Public Involvement Process and Tools

This portion of the memo identifies key public involvement activities that will be conducted during the project by the consultant team or agency staff members. This information will be updated during phase 3 of work for the project, to reflect current levels of effort by the project team.

Public outreach prior to each of the project decision points will be used to provide the public with meaningful opportunities to affect project outcomes. Community members will be provided an opportunity to comment on issues at hand. Effective documentation of public input will make it easy for community members to make a connection between their input and decisions.

Public input will be actively considered by the DAC and TAC in making recommendations at each decision point. The public also will have opportunities to provide input to decision-makers throughout the project. Documentation of the public involvement process will be provided in a technical report, including discussion of ways public input influenced the project outcome.

Stakeholders

Stakeholders in the process include local governments, transportation stakeholders, neighborhood and business stakeholders, media, advocacy groups, and Eugene and Lane County residents.

Table 1
Stakeholder Categories and Organizations

Stakeholder category	Examples
Local Governments	Lane Transit District, Lane Council of Governments, City of Eugene, City of Springfield, Lane County
Transportation stakeholders	Oregon Trucking Association, Bicycle Transportation Alliance
Media	Register Guard, local TV and radio stations, Oregon Daily Emerald (University of Oregon paper), Eugene Weekly
Advocacy Groups	Eugene Chamber of Commerce, Friends of Eugene, Friends of Delta Ponds, Sustainability Commission
Residents	Neighborhood associations, Eugene School District

Environmental Justice Outreach and Compliance

Regardless of concentration, members of all of these groups will be invited to participate in the planning process and accommodations will be made (e.g., translation services and transportation) to encourage their participation. As the project progresses, more information about area demographics will be available and will shape the outreach to these communities. Translation services and other special accommodations, such as provisions for the sight or hearing impaired, will be provided at all meetings upon request.

Public Information

The project does not assume any printed mailers (postcards) to be sent via the consultant team, but will rely on press releases and electronic notifications to inform the public about the project and answer common questions. Press releases will be posted on the ODOT Region 2, City of Eugene, and other web pages as appropriate. Press releases will also be transmitted to area news outlets, as suggested in the stakeholder list. A standard template will be used for the Plan to help keep all messaging consistent. Press releases will be published in advance of public events. A project logo will be designed and will be used on all project public information to create a unified "brand" for the project.

A contact list of interested parties will be developed by the City, including USPS mailing and email address for distribution of mailers and announcements. This list will not be publically distributed. The project will also rely on the DAC and TAC members to announce upcoming meetings to their constituents and distribution mailing lists.

Task	Responsibility	Schedule	Review
Press releases	City will distribute	Before public events	ODOT/CH2M
Advertisements	City will distribute	Before public events	ODOT/CH2M
Post Press Release to websites	City, ODOT, LCOG	Before public events	

Media Outreach and Advertising

The City will write and distribute press releases to all local media outlets (suggested in the stakeholder list). Media will be invited to attend all major public meetings in the hope that the media outlets will advertise the events, both before and after they occur.

Stakeholder Interviews

The City will identify a list of stakeholders that will be interviewed in the early phases of the planning process. These stakeholders could include those listed in the above table, or others as necessary. A summary will be produced to capture the overall perspectives of these stakeholders to share with the DAC and TAC, in addition to posting to the project website.

Project Website

A project web page will be developed to give the public a convenient way to stay informed about the project's progress and meeting schedule. The web page will be hosted and maintained by the consultant, in conjunction with the other TSP projects that are taking place at this time. This will help create a cohesive look for the area, while also providing a local look at transportation issues in Eugene. The site will include text, graphics, and links to PDF graphics and reports. The web page will include the following information:

- Project overview
- Project schedule
- Past and upcoming meetings
- Materials from open houses including displays and summaries
- Project deliverables (maps, evaluation criteria, alternatives, recommendations)

The project team will also post an online questionnaire/survey following each of the public workshops, to provide community members with an opportunity to provide input outside of the meetings. These will be developed and administered by the City, but imbedded into the project website.

The project website will be updated periodically by the consultant team to keep current information available for the public. Additionally, any opportunity to coordinate with existing web-based processes (such as Facebook) will be made.

Public Workshops

Three public workshops will be held for the TSP. The general goals for the events will be to inform the public and interested stakeholders about the plan's process. Specifically the first event will discuss the project goals, objectives, expected growth and needs. The second event will allow the public to review and comment on the preliminary concepts, while the third event will allow the public to review and comment on the refined concepts.

These events can be held in many venues; in place of a traditional open house (such as the City Library or City Hall). The project team may alternatively decide to host a booth at the farmers' market where people can learn about the project and provide input or have a station at other local events that residents/businesses will already be attended. If possible, either format should coordinate with the other TSP projects that are occurring in the area, to attract a larger public representation.

Task	Lead	Schedule
Produce an Open House Plan	CH2M HILL	To be determined
Schedule dates and locations of open houses	City of Eugene	To be determined
Design and produce displays, comment form, and other materials	CH2M HILL	To the City one week before the event for review
Summary of event and comments gathered	CH2M HILL	Within one week of event

Project Briefings

The Consultant Project Manager will participate in up to three rounds of briefings with local decision-makers to share information and invite participation. In addition, the PMT may wish to meet with neighborhood and community interest groups, and/or provide press releases to neighborhood and interest groups before key public meetings for their use in newsletters and email newsletters. Neighborhood and interest groups are important way to reach out to community members and encourage participation in project events.

Other Outreach Activities

In addition to the above, the City will conduct additional public outreach opportunities as necessary. These activities are expected to include the following, but could include other items as the plan progresses:

- Provide handouts/material about the plan to other events conducted by the City of Eugene or in the general area
- A variety of school-based programs can be used to gather input about the project or increase attendance at public meetings. One simple school-based outreach program is to conduct a coloring contest for elementary school children where a coloring sheet is sent home with children. Children send their art entries to the City of Eugene, the art is displayed at public events, and the winners are rewarded with a small prize. Through this process, parents are made aware of the project and might choose to attend a public meeting where their child's art will be displayed.
- To talk with a greater number of community members about the proposed project, a small number of community locations (schools during other events, Valley River Center, Farmer's market, University of Oregon, etc.) should be selected to host a table and discuss the project with passers-by. This strategy is an effective way to raise awareness about the project and to offer community members a chance to ask questions of staff.

Appendix J: Lane Transit District Long Range Transit Plan (2014)

The LTD Long Range Transit Plan can be found on the project website at the web address below. http://www.centrallanertsp.org/sites/default/files/AppendixK-LTDLong%20RangeTransportationPlan-re.pdf

Appendix K: Strategies for Transportation System Management and Operations (TSMO)

Menu of Strategies for Transportation System Management and Operations (TSMO)

#	Grouping	Strategy	Related Strategies	Description	Benefits	Estimated Cost	Application	Effect on Reliability	Key Benefit(s)	Prior Experience?	Estimated Cost Ra	Priority (Hi/Low)	Viability	DETAILED POLLS ON PRIORITY HI	MED	LOW	BLANK	Notes
A1	Arterial	Access Management		Access Management is the process that provides access to land development while simultaneously preserving the flow of traffic on the surrounding road system in terms of safety, capacity, and speed	- Reduction in accidents and accident rates by 40% on average - Increased LOS, capacity by about 40%, and speed by 50% to 90% - Other public benefits for pedestrians, bicyclists, public transit, taxpayers, and the environment	Cost spreads out across the board; cost is high when access rights are to be acquired	Political Factors = Access right acquisition, land use regulation and interest on different stakeholders should be taken into consideration Institutional Factors = Cooperation among and involvement of relevant government agencies, business owners, land developers and the public is necessary Technical Factors = Access management can be adopted easily in the pre-development stage, but extremely difficult in the post-development stage	Medium	Improved Mobility & Safety	60%	Low (unless access rights or property to be purchased)	MED	MED	4	2	1	3	- Cost should be medium
A2	Arterial	Advanced Signal Systems		Advanced signal systems include coordinated signal operations across neighboring jurisdictions, as well as centralized control of traffic signals which may include some necessary technologies for the later development of adaptive signal control.	- Reduced delay by 5% to 40%, travel time by 7% to 41% and stops up to 85% - Increased average vehicle speed - Reduced vehicle emissions by 2% to 13%, with fuel savings between 2% and 15%	$20 - $25 per foot for copper wire signal interconnect; $5000 per intersection for wireless interconnect (availability depends on agencies and signal locations); 1 - 2 million for signal system integration and firmware upgrade	Political Factors = New system needs to have significant advantage over the existing one to make the expenses reasonable Institutional Factors = Signal control across jurisdictions has to be coordinated, clear understanding of technology is necessary; system compatibility across jurisdictions may not be an issue in Oregon as they use the same signal system platform Technical Factors = Keep up with technology, consider risk/reward for "untested" technology	High	Reduced Congestion	60%	Medium-High	HI	MED	7	0	0	2	- Cost not that high - Project planned
A3	Arterial	Changeable Lane Assignments		The use of Changeable Lane Assignments Signs (CLAS) on frontage roads can mitigate the lane imbalances seen on a time-of-day recurring basis and during freeway incidents. As traffic signals have long been used as a time management technique for optimizing traffic operations, CLAS is used as a space management technique to add an additional dimension to optimization.	- Reduced delay by 1% to 26% and increased throughput by 50 to 1000vph during incidents		Political Factors = Institutional Factors = Requires interagency cooperation when part of a larger management strategy, such as incident management or integrated corridor management Technical Factors = Driver awareness and adjustment to their use. Require adequate approach and receiving lanes to facilitate their use.	Medium	Reduced Congestion		Low	LOW	MED	0	2	5	3	- Depends - Cost should be higher - Where appropriate
A4	Arterial	Signal Retiming / Optimization		Signal retiming / optimization includes updating signal timing plans for prevailing traffic conditions, interconnecting signals, and potentially upgrading signal technology to meet timing objectives.	- Reduced travel time by 10% to 20% - Decreased fuel consumption - High benefit-to-cost ratio which can range from 17:1 to 40:1	$20 - $25 per foot for copper wire signal interconnect; $5000 per intersection for wireless interconnect (availability depends on agencies and signal locations); $2,000 - $3,000 per intersection for signal retiming; $1,000 - $4,000 for controller + software replacement/upgrades; $10,000-$15,000 to replace signal control cabinets.	Political Factors = Prioritizing operational efficiency benefit over other projects Institutional Factors = Coordination and compatibility across agencies for new timing plans or signal system infrastructure Technical Factors = Understanding new technology, capabilities and limitations; Realize signal retiming and optimization should be revisited as needed, but every 3-5 years is recommended	High	Improved Mobility	70%	Low	HI	HI	7	1	0	2	
A5	Arterial	Red Light Cameras		Automated enforcement technologies can assist with the enforcement of traffic signal compliance. Still or video cameras, activated by detectors, can record vehicles traveling through a red signal.	- Decreased severity and number of turning/angle crashes (increased number of rear-end crashes) - 60-80% of drivers approve of their use based on survey data - 20-75% reduction in red light violations	$65,000 to $80,000 per intersection	Political Factors = Public perception of automated enforcement Institutional Factors = Who does the operations and maintenance? How are costs and profits distributed? Agencies should ensure clear laws or codes are in place to support automated enforcement (i.e. will citation go to registered vehicle owner or driver of vehicle at the time). Coordination with legal departments/lawyers maybe necessary upon start up due to law suits Technical Factors =		Improved Safety	10%	Medium	HI/LOW	MED	4	1	4	1	- No legislative approval for county use
A6	Arterial - On-Street	Parking Management		The management of on-street parking locations, durations, and vehicle types to allow more efficient use of existing roadway capacity and reduce potential conflicts which reduce traffic flow rates.	- Increased saturation/traffic flow - More efficient use of roadway capacity without adding new pavement	Minimal signing and striping costs	Political Factors = Prioritizing importance of moving vehicles vs. business access Institutional Factors = Easier to plan to manage parking on a new facility, than to remove or restrict on-street parking on an existing facility, Coordinate management strategy across jurisdictional boundaries when necessary Technical Factors =		Improved Mobility	20%	Low	HI/LOW	MED	3	0	4	3	- No issue yet
AF7	Arterial / Freeway	Active Traffic Management		Active traffic management consists of a combination of operational strategies that, when implemented in concert, fully optimize the existing infrastructure and provide measurable benefits to the transportation network and the motoring public. These strategies include but are not limited to speed harmonization, temporary shoulder use, junction control, dynamic signing and rerouting and managed lanes.	- Increase in average throughput in congested periods by 3% to 7% - Decrease in accident rate by 3 to 50%		Political Factors = Prioritizing operational efficiency benefit with existing system over expanded system capacity projects Institutional Factors = Key to have coordination and compatibility across agencies to maximize effectiveness Technical Factors = Understanding new technology, capabilities and limitations; Budget for training if new technology, and continued maintenance and support over life of technology; Consider risk/reward for "untested" technology		Improved Mobility	30%	Low-Medium	MED	MED	4	1	2	2	- "The high cost of free parking" is important to demand management - Project planned
AF8	Arterial / Freeway	Event Management		Event transportation management systems can help control the impact of congestion at stadiums or convention centers. In areas with frequent events, large changeable destination signs or other lane control equipment can be installed. In areas with occasional or one-time events, portable equipment can help smooth traffic flow.	- Reduced delay amidst heavy demand during special events - Reduced crash rates due to reduced conflicts - Increased attractiveness of event attendance, particularly repeat attendees	(System components are similar to Incident Management, which gives similar cost as that) $2,000 - $3,000 per intersection for specialized event timing plan; $20-$50 per hour per officer for manual traffic control; $2,000 - $3,000 per lane control display; $300K - $450K per lane control system including software, integration and other hardware costs	Political Factors = Frequent roadway detours and lane control measures may bring confusion and inconvenience to drivers and nearby residents Institutional Factors = Coordination with various event organizers and agencies is necessary Technical Factors = Events of various magnitude in different locations require different measures and scope of coordination	Medium	Reduced Congestion	30%	Low-Medium	MED	MED	4	2	1	3	
AF9	Arterial / Freeway	Integrated Corridor Management		With integrated corridor management, the various institutional partner agencies manage the transportation corridor as a system, rather than the more traditional approach of managing individual assets. Travelers could receive information that encompasses the entire transportation network. They could dynamically shift to alternative transportation options, even during a trip, in response to changing traffic conditions.	- Reduced travel time and delays - Increased reliability and predictability of travel	$2,000 - $3,000 per intersection for signal retiming; $50,000 - $100,000 per variable message signs depending on size; $1 - 3 million to design and implement; $100,000 - 2 million for annual O&M which varies among the scope of the system	Political Factors = Prioritizing management of the system over capacity expansion projects Institutional Factors = Interagency cooperation and implementation is key to project success Technical Factors = Understanding new technology, capabilities and limitations; Budget for training if new technology, and continued maintenance and support over life of technology.		Improved Mobility	30%	Medium	HI	MED-HI	5	1	2	2	- Project planned
AF10	Arterial / Freeway	Real-Time Traveler Information		Advanced communications have improved the dissemination of information to the traveling public. Motorists are now able to receive relevant information on location-specific traffic conditions in a number of ways, including dynamic message signs (DMS), highway advisory radio (HAR), and in-vehicle signing, or specialized information transmitted to individual vehicles. May include 511 systems.	- Reduced delay by 1% to 22% and number of stops by 5% to 6% - Reduced gas emissions by 3% to 5% - Decreased crash fatalities by 3%	$50,000 - $100,000 per variable message signs depending on size; $1 - 3 million to design and implement; $100,000 - 2 million for annual O&M which varies among the scope of the information system	Political Factors = Prioritizing information systems over regular infrastructure projects. Public perception can be high with this implementation. Institutional Factors = Agency partnership and data/resource sharing to create a robust system. Technical Factors = Rapidly changing field, user understanding is key	High	Improved Mobility	40%	Low (if little added infrastructure), High (if added infrastructure)	HI	HI	8	1	1	0	- Very important - Tripcheck survey indicates some people did choose different option or delayed trip because of information
AF11	Arterial/Freeway	Real-time Traffic Data Collection Using Probe Data		Automobiles are used to monitor the surrounding environment with an onboard computer. Data are sent to a Web server through pre-existing Wi-Fi networks, which help drivers track conditions specific to their cars and provides historical and real-time traffic conditions at different times of the day using combined data from all service subscriber participants.	- Reduce travel time and delay by alerting and informing drivers of congested areas - Reduce potential crashes due to congestion	$300 per GPS unit; $150 per year for operation (DASH)	Political Factors = Institutional Factors =Is the GPS vehicle data shared with the agency and at what cost? Technical Factors = Understanding new technology, capabilities and limitations; Integration with other ITS components	High	Improved Mobility		Low	MED	MED	3	2	3	2	- Data needs to be collected to make use of it - Implementation seems difficult
AF12	Arterial/Freeway	IntelliDrive (VII)		VII is a research program focused on enabling wireless communications among motor vehicles and between motor vehicles and roadside infrastructures. This involves various public and private sector entities. By enabling secure real-time communications with motor vehicles, new services will be enabled to enhance transportation safety, mobility, and commerce.	- Decrease traffic accidents and fatalities - Reduced delays - Increased effective roadway capacity	$10,000 to $15,000 per VII roadside equipment installation	Political Factors = Institutional Factors = Coordination between agencies is critical to provide uniform driver information Technical Factors = VII is under development and considerable amount of time is needed before large scale deployment is possible and communication infrastructure is mature		Improved Mobility & Safety		High	LOW	LOW	0	1	4	5	- Wait for vehicle technology - ?
AF13	Arterial/Freeway	Automated Speed Enforcement		Automated speed detection (typically in work zones) can enable automated ticketing of vehicles exceeding posted speed limits when combined with automatically triggered vehicle identification technologies such as photographs, still or video digital imaging, or license plate recognition. Some systems transmit images of offending vehicles to police officers downstream of the work zone where enforcement can be carried out more safely.	- Increased perception of safety - Reduced travel speeds	$650,000 EUROS per vehicle mounted camera (~$850,000 US) $15,000 EUROS per fixed location installation (~$20,000 US)	Political Factors = Public perception of automated enforcement Institutional Factors = Who does the operations and maintenance? How are costs and profits distributed? Technical Factors =		Improved Safety		Medium-High	MED	LOW-MED	3	3	2	2	- Not allowed by ???? county
AF14	Arterial/Freeway	Traffic Surveillance		Many of the services possible through arterial and freeway management systems are enabled by traffic surveillance and detection technologies, such as sensors or cameras, monitoring traffic flow.	- Improved incident response times and accuracy - Real-time and historic system operations information - Improved visual information for decision-makers and the public	$15,000 - $30,000 per CCTV detection unit, $1 - 2 million for central system integration and firmware upgrade if run through a TMC	Political Factors = Public perception of "big brother" surveillance and invasion of privacy Institutional Factors = Sharing communication infrastructure and broadcasts across agencies. Technical Factors = Integrating with other TSMO or ITS components		Improved Mobility	50%	Low	HI	HI	6	1	1	2	- CCTV's
AF15	Arterial/Freeway	Emergency Management		ITS applications in emergency management include hazardous materials management, the deployment of emergency medical services, and large and small-scale emergency response and evacuation operations.	- Reduced incident response time - Improved HAZMAT and counterterrorism technology - Improved travel time and less congestion under evacuation scenarios (reversible lanes)	Cost varies depending on the scale and scope of the emergency mangement system; cost of an emergency operation center may range from $150K to $5 million; Hazmat transportation operation technology may range from $250 to $3,500 per vehicle. GPS/ AVL on emergency vehicles costs $4,000 per intersection and $2,000 per vehicle.	Political Factors = Viewed as proactive protection of public safety Institutional Factors = Coordination between agencies is critical to success Technical Factors = Integration of multiple ITS components may aid in project effectiveness		Improved Safety	40%	Varies depending on system complexity	HI	VARIES	7	0	0	3	- Very important
F16	Freeway	Incident Management		Incident management systems can reduce the effects of incident-related congestion by decreasing the time to detect incidents, the time for responding vehicles to arrive, and the time required for traffic to return to normal conditions. Incident management systems make use of a variety of surveillance technologies as well as enhanced communications and other technologies that facilitate coordinated response to incidents.	- Reduced average incident duration by 28% to 70% - Decreased secondary crashes by up to 28% to 70% - Reduced delay due to quicker incident response	$15,000 - $30,000 per CCTV detection unit, $400 per loop detector; $55 per vehicle hour for patroling vehicle; $8,000 - $13,000 per unit of mobile incident investigation equipment	Political Factors = Prioritizing incident response/system management over system expansion Institutional Factors = Various agencies and first responders need to be coordinated, inter-agency communication is the key; systems may provide flexibility for future installation and coordination by neighboring jurisdictions Technical Factors = A sound communication system with wide coverage is crucial; interoperability issue among different agencies	Medium	Improved Mobility & Safety	30%	Low	HI	HI	8	0	0	2	- Work with ODOT on detours
F17	Freeway	Work Zone Management		ITS applications in work zones include the temporary implementation of traffic management or incident management capabilities. These temporary systems can be stand-alone implementations or they may supplement existing systems in the area during construction. Other applications for managing work zones include measures to control vehicle speeds and notify travelers of changes in lane configurations or travel times and delays through the work zones. ITS may also be used to manage traffic along detour routes during full road closures to facilitate rapid and safe reconstruction projects.	- Reduced traveling speed across work zone by 9mph in a Minneapolis/St. Paul study - Improved safety with reduced travel speed - Reduced delay by 46% to 55% and travel time	$150 - 800k for a work zone management system, which commonly includes variable message signs ($50k-120k capital, $2.5k-6k operations and maintenance), CCTV-surveillence ($7k-19k capital, $1.0k-2.5k operations and maintenance), Highway Advisory Radio ($16-32k capital, $500-1,000 operations and maintenance), traffic detectors ($3-13k capital, $100-1,000 operations and maintenance) and variable speed limit display ($3-5k capital), etc. Costs are dependant on agency leasing or purchasing, and portable versus permanent components.	Political Factors = Prioritizing safety over system capacity expansion projects Institutional Factors = Technical Factors = Coordination with other ITS components	High	Improved Mobility & Safety	20%	Low (if little added infrastructure), High (if added infrastructure)	HI/LOW	MED	4	1	3	2	- Large projects need to integrate TDM for travelers before breaking ground

F18	Freeway	High Occupancy Vehicle (HOV) and High Occupancy Toll (HOT) Managed Lanes		HOV lanes carry vehicles with a higher number of occupants, which serve to increase the total number of people moved through a congested corridor. In general, carpoolers, vanpoolers, and bus patrons are the primary beneficiaries of HOV lanes by allowing them to move through congestion. HOT lanes allow single occupancy vehicles use the HOV lanes for a toll.	- Improved people throughput by allowing a higher flow for HOV - Incentive for carpooling/vanpooling/transit - Can remove vehicles from roadway, reducing emissions	$100,000 to $3 million per mile capital costs, depending on need to reconstruct lanes or not. Low operations and maintenance costs, generally.	Political Factors = High public perception, involves public policy decision for prioritizing people movement over individual vehicle movement. Institutional Factors = If congestion spans agencies, they should work together to implement consistent TSMO strategies to realize full benefits. Technical Factors = May increase congestion for general purpose lane	Medium/High	Improved Mobility	20%	Low (if restriping/signing), High (if new construction)	MED	MED	3	2	4	1	- Need policy for when will be the tipping point for this
F19	Freeway	Reversible Lanes		Traffic sensors and lane control signs can be used to implement reversible flow lanes allowing travel in the peak direction during rush hours or for special events/emergencies.	- Reduced crash rates due to decreased congestion - Improve travel time and delay in peak directions - More efficient use of existing roadway pavement/capacity	$2,000 - $3,000 per lane control display; $300K - $450K per lane control system including software, integration and other hardware costs	Political Factors = May create confusion for infrequent drivers Institutional Factors = Education for the public on what they are expected to do during contra-flow situations is necessary Technical Factors = New technology in US		Reduced Congestion		Medium-High	LOW	LOW	1	1	5	3	
F20	Freeway	Lane Controls / Temporary Shoulder Use		Lane control signs, supported by surveillance and detection technologies, allow the temporary closure of lanes to avoid incidents on freeways, or use of shoulders as a travel lane to increase capacity.	- Reduced crash rates - Improve travel time and delay in peak directions - More efficient use of existing roadway pavement/capacity	$2,000 - $3,000 per lane control display; $300K - $450K per lane control system including software, integration and other hardware costs	Political Factors = May create confusion for infrequent drivers Institutional Factors = Education for the public on managed lane signage and operations Technical Factors = New technology in US		Reduced Congestion		Medium-High	LOW	LOW	1	1	4	4	- Needs more research
F21	Freeway	New Toll Roads / Congestion Pricing		Congestion pricing is a way of harnessing the power of the market to reduce the waste associated with traffic congestion. Congestion pricing works by shifting purely discretionary rush hour highway travel to other transportation modes or to off-peak periods, taking advantage of the fact that the majority of rush hour drivers on a typical urban highway are not commuters.	- Provided high level of service to users, with 20% decrease in traffic for the London case - Divert traffic to another mode or to travel at different times of the day	~$250,000 per mile for conversion of HOV to HOT lanes; $2 - 4 million per lane per mile for new construction of HOT lanes $2 million for conversion of HOV to HOT lanes; $85 to $177 million for new construction of HOT lanes	Political Factors = Can be publicly controversial, tough to establish toll facilities if the concept is new to a region or not widely practiced Institutional Factors = Technical Factors = Effects of different tolling methods vary, benefits versus costs need to be carefully considered	Medium	Improved Mobility	10%	High	MED	LOW	3	3	2	2	- Great TSMO/TDM strategy
F22	Freeway	Electronic Toll Collection		Electronic toll collection (ETC) supports the collection of payment at toll plazas using automated systems to increase the operational efficiency and convenience of toll collection. Systems typically consist of vehicle-mounted transponders identified by readers located in dedicated and/or mixed-use lanes at toll plazas	- Reduced traffic volume by up to 17% - Reduced delay by 50% to 85% - Reduced vehicle emissions by 16% to 63% - Cost saving for electronic toll lane over staffed lane (ETC only requires one maintenance person and account support)	~$1 million hardware cost for a 7-lane toll plaza; $16,000 per year to operate an electronic toll collection lane; $0.05-0.10 cost per ETC transaction; $15-$50 cost for each transponder	Political Factors = Privacy concern on vehicle and personal information with the use of tolling technologies Institutional Factors = Interoperability issues at the transponder level with neighboring toll facilities Technical Factors = Plan for changes in tolling technologies so that interoperability can be attained easily in the future	High	Reduced Congestion		High	MED	LOW	2	2	2	4	- Along with new project
F23	Freeway	Road Weather Information Systems		Surveillance, monitoring, and prediction of weather and roadway conditions enable the appropriate management actions to mitigate the impacts of any adverse conditions.	- Improved safety by reducing 3 to 17% of crashes - Reduced vehicle speed by 2 to 5mph during adverse weather - Improved information for agency decision-makers and travelers	Cost varies which can range from $20,000 for a sensor unit to over $3 million for a weather management system. Weather station ($20-50k capital, $1.5-4k operations and maintenance), CCTV-surveillance ($7k-19k capital, $1.0k-2.5k operations and maintenance), Highway Advisory Radio ($16-32k capital, $500-1,000 operations and maintenance), variable message signs ($50k-120k capital, $2.5k-6k operations and maintenance), and variable speed limit display ($3-5k capital).	Political Factors = Prioritizing safety over expanded system capacity Institutional Factors = Interagency cooperation provides greatest benefit to traveling public Technical Factors = Integration of various ITS components	High	Improved Safety	20%	Low-Medium	HI/LOW	MED	3	0	5	2	- Network & weather stations - good for maintenance too - Seems mainly abide urban area
F24	Freeway	Bottleneck Removal		Bottleneck removal in freeway can be achieved by various geometric or operational strategies after identifying the bottleneck locations and detecting the causes.	- Decreased injury crash rate by 35% on average - Reduced delay	Cost varies, can range from a few thousand dollars to tens of millions	Political Factors = Institutional Factors = Technical Factors = Sufficient and accurate data collection is important for bottleneck analysis and the subsequent mitigation	High	Reduced Congestion	10%	Medium-High	HI	MED	8	1	0	1	
F25	Freeway	Ramp Closures		Surveillance and control technologies can allow for the temporary closure of freeway ramps to accommodate peak traffic conditions or inclement weather conditions.	- Reduced crash rates - Increased mobility on mainline		Political Factors = Limits access to roadways, which can lead to public frustration. Institutional Factors = Can move congestion onto surface street system Technical Factors = Should be integrated with other ITS components (traffic management center, weather management system, etc)	Medium	Improved Mobility & Safety		Low	MED	MED	1	2	3	4	- Impact to arterial streets and tradeoff with freeway operations
F26	Freeway	Ramp Metering		Traffic signals on freeway ramp meters alternate between red and green signals to control the flow of vehicles entering the freeway. Metering rates can be altered based on freeway traffic conditions.	- Reduced mainline peak period delay - Increased freeway speed by 8% to 26% - Improved freeway capacity by 10% (Minneapolis study) - Reduced duration of congestion - Reduced vehicle conflicts by 24% to 50%	$25,000 - $66,000 per site; $6,500 for detection components per site; $1,000-$3,000 per site for annual operation and maintenance	Political Factors = Public perception and potential resistance Institutional Factors = Agency coordination on operations to ensure ramp queues don't impact surface street operations. Technical Factors = Ensure infrastructure and timing plans allow green time to meet demand. Avoid queue spillback to adjacent intersections.	High	Reduced Congestion	20%	Low-Medium	HI	HI	5	1	1	3	
F27	Freeway	HOV Ramp Bypass		Priority access to highway is given to HOVs. Access options include allowing HOVs to bypass ramp meters, providing a dedicated flyover ramp for HOVs, etc.	- Reduced passenger travel time by 2% to 15% - Incentive for carpooling/vanpooling/transit - Can remove vehicles from roadway, reducing emissions by 2% to 13%	$100,000 to $3 million per mile capital costs, depending on need to reconstruct lanes or not. Low operations and maintenance costs, generally.	Political Factors = High public perception, involves public policy decision for prioritizing people movement over individual vehicle movement. Institutional Factors = Agencies should work together to develop a ramp metering system and timing plan to avoid queue spillback to upstream intersections. Technical Factors =	Medium	Improved Mobility	10%	Low (if restriping/signing), High (if new construction)	LOW	LOW	1	1	4	4	- Not without highway system
F28	Freeway	Transportation Management Center		The purpose of a Transportation Management Center is to integrate various departments and offices of transportation and emergency agencies into a unified communications center. The integration provides the communications and computer infrastructure necessary for coordinated transportation management on roadways during normal commuting periods, as well as during special events and major incidents.	- More efficient coordination and operation of various transportation systems - Better data collection for decision-making and future planning purposes - Co-locate and collaborate with traffic, transit, fire, emergency, police, etc.	$1.8 million - 10 million for TMC capital cost; $400K - $2 million for annual O&M	Political Factors = Expenses may be huge depending on the scope of the TMC Institutional Factors = Communication and interoperability issues may exist among agencies. Changing agency culture to operate differently. Potential collaboration with transportation, emergency, police, fire, etc. Technical Factors = TMC's can be very simple or complex. Understanding technology is key to maximizing benefits.	High	Improved Mobility & Safety	20%	High	HI	MED	6	1	0	3	- Under construction
F29	Freeway	Variable Speed Limits		Variable speed limit systems use sensors to monitor prevailing traffic and/or weather conditions, posting appropriate enforceable speed limits on dynamic message signs. Also known as "speed harmonization."	- Decreased mean travel speeds by up to 3mph - Reduced crash rates - Reduction of congestion	$3000 - $5000 per variable speed display sign	Political Factors = Potential need to increase law enforcement of variable speeds Institutional Factors = Cooperative or identical systems should be used across jurisdictional boundaries Technical Factors = Integration into detection/surveillence and communication systems	High	Reduced Congestion & Safety		Low-Medium	HI	HI	5	2	1	2	- Need good enforcement & new laws - Project planned
FR30	Freight	Real-Time Freight Information		Real-time information on cargo status can be provided to ocean carriers, exporters, importers, foreign freight forwarders, customs brokers, terminal operators, and rail and trucking services. It enables port users to post and receive information on the location and status of freight shipments.	- Ability to track the freight location and estimate the traffic condition for real-time freight route planning - Increased freight movement efficiency	Ranges from $500 to $2,500 per in-vehicle tracking equipment depending on the functionality	Political Factors = Prioritizing freight movement over people Institutional Factors = Technical Factors = Integration with other ITS components (i.e signal system for truck priority)		Improved Mobility		Low	MED	MED	2	1	4	3	- Depends on area - Not sure which is provided ???? within the freight industry
FR 31	Freight	Roadside Electronic Screening / Clearance Programs		Electronic screening applications promote safety and efficiency for commercial vehicle operators. Carriers that equip their fleets with low-cost in-vehicle transponders can communicate with check stations and automatically transfer regulatory data to authorities as trucks approach check stations. These and other technologies such as weight-in-motion (WIM) scales improve efficiency and reduce congestion at check stations by allowing safe and legal carriers to bypass inspections and return to the mainline without stopping.	- Reduced inspection time by 14% to 66% - Reduced freight travel time and delay - Reduced vehicle emissions	$150k to $780k per electronic screening weigh station	Political Factors = Institutional Factors = Technical Factors = Integration with other ITS components (i.e freight AVL)		Improved Mobility & Safety		Medium-High	MED	MED	2	1	1	6	- Existing?
FR32	Freight	Truck Only Lanes		Truck-only lanes are lanes designated for the use of trucks. The purpose of truck-only lanes is to separate trucks from other mixed-flow traffic to enhance safety and/or stabilize traffic flow.	- Increased highway safety - More stable traffic flow	$100,000 to $3 million per mile capital costs, depending on need to recor	Political Factors = Prioritizing freight movement over people Institutional Factors = Technical Factors = Truck only lanes are not common in the US	Medium	Improved Mobility & Safety	10%	Low (if restriping/signing), High (if new construction)	MED	MED	2	0	3	5	
FR 33	Freight	Truck Signal Priority		Truck signal priority is used to improve the operation of heavy trucks passing through traffic signal controlled intersections on rural high-speed highways, by adding vehicle detectors that would respond only to trucks.	- Reduced number of truck stops, which is estimated to cost $3 per truck per stop	$30,000 per inductive loop truck detector; $5,000 per intersection for data collection and retiming effort	Political Factors = Institutional Factors = Technical Factors = Adjusts the traffic actuated signal systems which can decrease the presence of vehicles in the dilemma zone, potentially resulting in a safety issue		Improved Mobility	10%	Low	HI/LOW	MED-HI	4	1	3	2	- Good for safety - With demonstrated benefit
FR 34	Freight	Vehicle Tracking (AVL)		Automated vehicle location, together with computer aided dispatch systems, can assist carriers with scheduling and tracking of vehicle loads.	- Increased fleet productivity by 5% to 25% - Improved HAZMAT safety and security by reducing potential terrorist consequences by approximately 36%	Ranges from $500 to $2,500 per in-vehicle tracking equipment depending on the functionality	Political Factors = Institutional Factors = Technical Factors = Integration with other ITS components (i.e signal system for truck priority)		Improved Mobility	10%	Low	MED	MED	2	0	3	5	
T35	Transit	Park and Ride Lots		Park and ride facilities are public transport stations that allow commuters and other people wishing to travel into city centers to leave their personal vehicles in a car park and transfer to a bus, rail system or carpool for the rest of their trip.	- Eased congestion and parking demand in city center	Grade-Level Surface Parking - $5,000 per stall Freestanding Parking Garage Above-Grade - $18,000 per stall Below-Grade - $40,000 per stall	Political Factors = Institutional Factors = Technical Factors =		Reduced Congestion	50%	Medium-High	MED	LOW-MED	3	3	2	2	- So we may need bike facilities
T36	Transit	Real-Time Transit Information		Transit agencies can disseminate both schedule and system performance information to travelers through a variety of applications, in-vehicle, wayside, or in-terminal dynamic messages signs, as well as the internet or wireless devices. Coordination with regional or multimodal traveler information efforts can also increase the availability of this transit schedule and system performance information.	- Enhanced passenger convenience - Increased attractiveness of transit	$1 - 4 million for a real-time transit information system $7,000 per "next stop" annunciator	Political Factors = Objection from union on adopting ITS due to the increased probability of layoff Institutional Factors = Cooperation and integration between agencies and their ITS systems is beneficial Technical Factors = GPS location refreshing rate is critical for real-time transit information but limited by communication bandwidth; lack of IT expertise in transit agency to implement ITS due to the lack of understanding of IT in transit; system will get outdated quickly as new technologies come out fast (i.e. putting up message board at transit stop may not be worthwhile if everyone can use their cell phone to check the transit arrival time)		Improved Mobility	20%	Medium-High	HI	MED	5	0	2	3	- Need smaller transit systems to join info platform with TriMet
T37	Transit	Transit Signal Priority		Transit signal priority systems use sensors to detect approaching transit vehicles and alter signal timings to improve transit performance. For example, some systems extend the duration of green signals for public transportation vehicles when necessary.	- Improved Overall Travel Time by 2% to 42%/Reduced Delay up to 48% - Improved Travel Time Reliability/Less Variability - Fleet reduction - Reduced system operational costs (number of buses and fuel costs)	$5k to $35k per intersection; $2k to $14k per bus	Political Factors = Willingness to prioritize transit over other modes Institutional Factors = Signal system capabilities across agencies Technical Factors = Infrastructure to support TSP (i.e. controllers); lack of IT expertise in transit agency to implement ITS due to the lack of understanding of IT in transit; system will get outdated quickly as new technologies come out fast; Transit preferential treatments in place always, or by time of day, number of riders, and schedule adherence.		Improved Mobility	30%	Low	HI	MED	5	2	2	1	- ???? ITS use - Make surface transit more competitive with private vehicle travel time
T38	Transit	Transit Only Lanes/Queue Jumps		Transit-only lanes are lanes designated for the use of transit vehicles only. The purpose of transit-only lanes and transit queue jumps are to provide preferential treatments to give transit an advantage over other roadway modes.	- Reduced transit delay - Improved transit travel times - Increased transit ridership	Political Factors = Willingness to prioritize transit over other modes including right-of-way costs) $100,000 to $3 million per mile capital costs, depending on need to reconstruct lanes or not. Low operations and maintenance costs, generally.	Institutional Factors = Signal system capabilities Technical Factors = Infrastructure to support transit preferential treatments (controllers, interconnect, etc); Transit preferential treatments in place always, or by time of day, number of riders, and schedule adherence.		Improved Mobility	20%	Low (if restriping/signing), High (if new construction)	MED	LOW-MED	2	1	3	3	- Make surface transit more competitive with private vehicle travel time
T39	Transit	Vehicle Tracking (AVL)		Automatic vehicle location (AVL), together with computer aided dispatch (CAD) systems, facilitates the management of transit operations, providing up-to-date information on vehicle locations to assist transit dispatchers as well as inform travelers of bus status.	- Enhanced passenger convenience - Better on-time performance, early and late arrivals were decreased by 12 and 21% respectively in a Denver study, performance increased from 80% to 90% in Kansas City - Lower operation and maintenance cost due to smaller fleet size needed, without degradation in customer service	$3,000 - $6,000 per GPS equipment installation; $60,000 - $70 million depending on the size of fleets	Political Factors = Objection from union on adopting ITS due to the increased probability of layoff Institutional Factors = Multiple AVL systems may have to be installed for various transit ITS strategies due to limitations from system vendors Technical Factors = System compatibility and future upgrade potential; lack of IT expertise in transit agency to implement ITS due to the lack of understanding of IT in transit; system will get outdated quickly as new technologies come out fast		Improved Mobility	10%	Low	MED	MED	2	2	2	4	- Provides more reliable schedules which benefits riders

Travel Options Strategies

TO40	Travel Options	Mass Communication		Mass Communication uses media, advertising and marketing campaigns to increase public awareness of the benefits and availability of transportation options, and to connect people with transportation services.	• Decrease in drive-alone trips in favor of transportation options • Increase in awareness of regional transportation options and the need to use efficient options • Increase in brand identity that connects the public with the transportation system and services • Ability to introduced new transportation infrastructure to a broad audience of potential users	• $500,000 per year builds awareness to approximately one-third of residents and is necessary to maintain and increase that awareness several percentage points per year	Political Factors • Different stakeholder interests should be considered Institutional Factors • Multi-agency partnerships are required to advance and reinforce campaign messages and strategies		Improved Mobility									
TO41	Travel Options	Individualized Marketing		Reaching individuals with personalized information and assistance by neighborhood or target audience.	• Projects in inner Portland yield an 8 percent to 12 percent reduction in drive-alone trips • Ability to introduced new transportation infrastructure to a targeted audience of potential users	• Costs are scalable at $15 to $20 per household; however, projects are typically $500,000 to reach 25,000 or more households	Political Factors • Positive results: the City of Portland and TravelSmart in Victoria Australia have noted public support for transportation in neighborhoods that receive individualized marketing Institutional Factors • Partnerships should be formed in order to deliver the best assistance to individuals Technical Factors • Staff resources must be allocated in a planned fashion so that orders are filled soon after individuals request assistance		Improved Mobility & Safety									
TO42	Travel Options	Traveler Information Marketing Campaigns		Not only marketing the information services available but also building familiarity for checking information sources before embarking on a trip.	• Improve travel times by giving drivers tools for timing their trips	• Cost will depend on how this information is delivered (one-on-one communication or advertisements)	Political Factors • Brand identity is often associated with specific agencies which may not see the value of consolidating into one brand, such as 511 Institutional Factors • Marketing of traveler information tools should link to other travel options marketing efforts Technical Factors • Tools currently available are likely programmed in different web programming languages		Reduced Congestion & Improved Mobility									
TO43	Travel Options	Route Planning Tools (software)		Develop a regional multi-modal trip-planning tool.	• Introduce more people to travel options for all trips • Compare time and cost between modes to encourage efficient travel choices	• TriMet's project will total around $130,000. This includes development of the tool but takes advantage of existing data and web server capacity to operate	Political Factors • Different stakeholder interests should be considered Institutional Factors • Marketing can help build familiarity with route planning tools Technical Factors • Regularly updating data • Maintaining server capable of meeting usage rates of the tools, especially during peak demand (for example, during a weather event)		Improved Mobility & Safety									
TO44	Travel Options	Employer Program		Support employers and commuters to increase the use of travel options for commute trips.	• Employers are assisted in implementing an auto-trip reduction plan tailored to their work site location and employees. Benefits are directly related to commute incentives implemented by employer (see below)	• TriMet Employer Outreach has resulted in cost-per-vehicle-mile-reduced annually of $0.01. • The RTO program uses a reference point of $0.05/VMR annually in order to make investments that will reach Strategic Plan goals	Political Factors • None, many employers appreciate receiving help from the Employer Program Institutional Factors • Large employers (more than 100 employees) are affected by the DEQ Employee Commute Options (ECO) Rules and are therefore compelled to seek support to reduce auto trips • Many partnerships are already in place Technical Factors • RTO staff is implementing a coordination plan which will improve efficiency of delivering employer outreach services. The coordination plan has prioritized a customer relationship management (CRM) online database application		Improved Mobility & Safety									
TO45	Travel Options	Commuter Incentives		Incentives to reduce single-person vehicle trips made by commuters by offering them time or cost savings; and, rewards.	• Transit subsidies are currently offered by 881 employment sites. Transit ridership goes up and drive-alone commutes go down at these sites • In addition to financial incentives, a 2006 Portland State University (PSU) study found that non-financial incentives (for example, flex-time, emergency ride home, etc.) resulted in significantly higher use of non-drive alone travel options	• Costs are generally paid for by private entities (employers and prize donations to commute challenges)	Institutional Factors • Large employers (more than 100 employees) offer incentives to demonstrate their effort to reduce auto trips in order to comply with the DEQ ECO Rules • TriMet has over 10 years of an established program with a variety of options for employers to subsidize transit Technical Factors • Administrative time is needed to process contracts and fulfill incentives		Improved Mobility									
TO46	Travel Options	Rideshare Services		Rideshare services involve online carpool matching, assistance to employers to match their employees and vanpools. Vanpools that meet program criteria, such as travelling at least 20 miles round-trip, are given a partial subsidy as an incentive.	• Carpools and vanpools reduce miles traveled for people who would otherwise choose to drive • Carpools and vanpools create a mobility option for people who do not drive and cannot take transit • Vanpools take cars off the region's freeway system during peak hours	• Costs for the maintenance of an online carpool matching system are approximately $30,000 per year • Metro VanPool's cost per van is approximately $500 monthly	Political Factors • Not all of Oregon is using the same online-ridematching tool • Questions are addressed in a coordinated way about who pays for vanpools originating in Washington State and Salem • Employers are not strictly exempted in Oregon from liability if a vanpool crashed Institutional Factors • There are only 3.4 miles of carpool lane in Oregon which means the incentive to save time is low • Metro currently leases vans; however, Washington State's model of owning a vanpool fleet shows lower operational costs once the capital investment has been made Technical Factors • The current online carpool matching software was quickly outdated. Metro will transition to using new software purchased by Washington State		Improved Mobility									
TO47	Travel Options	Telecommuting		An employee works from home or a satellite office space on a regular basis. Of course, this type of strategy does not work for all types of employment such as manufacturing.	• Likely to remove auto trips directly from peak commute times • Infrastructure is critical during catastrophic events to restore commerce	• Less than 1 FTE typically provides employer outreach specializing in telecommuting	Political Factors • Benefit to having infrastructure in place to rebound from catastrophic events. Can be linked to emergency management plans Institutional Factors • Some employers will not allow telecommuting for a variety of reasons Technical Factors • While high-speed internet is useful, telecommuting can be arranged simply by correspondence over the phone		Reduced Congestion									
TO48	Travel Options	Urban Centers, Corridor and Industrial Area Investments		Reduce barriers to non-auto travel by coordinating development of end-of-trip facilities, parking, carsharing locations and other strategies that complete urban centers, corridors and industrial areas. This strategy often involves public-private partnerships such as Transportation Management Associations. These organizations address needs relevant to their location.	• Local presence in centers, corridors and industrial areas • Leveraged local investment	• $15,000 to $50,500 per TMA annually, depending on meeting performance measures	Political Factors • City jurisdictions must be a partner of public-private partnerships like TMAs • TMA policy is set by Metro Council resolutions Institutional Factors • For-profit carsharing companies will not risk locating beyond their market without a revenue guarantee Technical Factors • Employer Program coordination is required to assure performance measures are met and to avoid overlapping efforts		Improved Mobility & Safety									
TO49	Travel Options	Bicycle Signal Heads		Bicycle signal heads are traffic signal displays devoted to improving flow of cyclists at intersections. They may offer movements for cyclists that wouldn't otherwise be possible at the intersection. Also referred to as scramble phases.	- Reduced travel time by 10% to 20% - Increased use of cycling for all trips - Further propel the Portland-metropolitan region as the most Bicycle Friendly Community	• Approximately $25,000 per bicycle signal head and mounting; $1,500 per loop detector to detect bicycles	Political Factors • Bicycle signal heads have not been approved by the Federal Highway Administration • Auto traffic congestion caused by exclusive phase, resulting in complaints Institutional Factors • Concern about implementation due to lack of FHWA approval Technical Factors • Potential for unfamiliar drivers to be confused by bicycle signal • Increased cycle length will increase average delay for all other modes		Improved Safety									
TO50	Travel Options	Bicycle Enhancements		A wide range of engineering techniques to improve bicycle conditions; this may include concepts like the green wave (signal timing for cyclist speeds), bicycle count locations where feedback to the users encouraged additional activity, and wayfinding systems.	- Reduced stops for cyclists - Provide positive reinforcement for cyclists - Innovative technique not used in the U.S.	• For implementation of green wave: o $20 to $25 per foot for copper wire signal interconnect; $5,000 per intersection for wireless interconnect (availability depends on agencies and signal locations) o $3,000 to $5,000 per intersection for signal retiming o $1,000 to $4,000 for controller plus software replacement/upgrades (if necessary)	Political Factors • Potential to increase complaints from drivers about traffic signal timing and maintenance • Reduced air quality due to increased idling at traffic signals (not in all cases) • Auto traffic congestion resulting in complaints Institutional Factors • Cycle lengths may need to be revised, which requires comprehensive evaluation of a corridor Technical Factors • Increased maintenance costs due to braking caused by heavy vehicles		Improved Bicycle Mobility & Safety									

Appendix L: Eugene Airport Master Plan (2010)

The Eugene Airport Plan can be found on the project website at the web address below.
